In order to best interpret the chemical images obtained using new microanalytical techniques such as ion microscopy (IM), it is advantageous to correlate them with the morphologic/chemical information provided by more conventional light microscopy (LM), secondary electron imaging (SEI), backscattered electron imaging (BEI), or electron probe microanalysis (EPMA). Accordingly the authors have devised a technique of specimen preparation which allows for the application of several different microanalytical techniques to a single histologic section mounted on the same substrate. The technique described offers the advantages of: (1) selecting specific areas within a section by LM for subsequent microanalysis; (2) facilitating the comparison of microanalytical methods in terms of sensitivity and spatial resolution, and (3) allowing for LM, SEI, BEI and EPMA both before and after IM yielding valuable information on differential sputtering effects (Farmer et al., 1981) and contaminants, two major potential sources of IM data misinterpretation. (4 refs.)

104145 A high-resolution staining method for examination of mammalian cell surfaces in the light microscope. S.Junker (Inst. of Human Genetics, Univ. of Aarhus, Aarhus, Denmark).
J. Microsc. (GB), vol.131, pt.2, p.235-9 (Aug. 1983).
A simple light-microscopic method for the examination of fine details on cell surfaces is described. When cell specimens on platinum-coated glass or plastic surfaces are stained with 3,3'-diaminobenzidine tetrahydrochloride and hydrogen peroxide, fine cytoplasmic processes that cannot be detected using conventional staining techniques for the light microscope are revealed. It is suggested the new technique be applied instead of the scanning electron microscope when the limited resolution of the light microscope is sufficient. (9 refs.)

104146 Automatic ultramicrotome advance system for routine histological investigations with the electron microscope. B.Wolf, A.Schwinde (Inst. fur Immunbiologie, Univ. Freiburg, Freiburg, Germany).
Microsc. Acta (Germany), vol.87, no.3, p.301-6 (May 1983). In German.
In modern ultramicrotomes the thermic advance system has been replaced by a mechanical one. Earlier, conventional DC-voltage motors were used, but recently the step motor has become popular. In connection with such motors, the application of digital control elements is facilitated, thus increasing precision significantly. A further step towards improving the precision of the advance system is the application of microprocessors as intelligent and interacting control elements. The microprocessor can not only process the output of sensors, but also perform the function of regulation. This paper describes a working concept whereby the advance system does not, as usual, work freely, but in connection with a sensor which measures the advance, and after a positive data comparison by the microprocessor, allows the cutting movement. The concept is not limited to ultramicrotomes but can also be applied to mechanical rotation microtomes. (8 refs.)

104147 A fluid exchange apparatus for the processing of biological specimens for electron microscopy. J.N.Brown (Dept. of Physiology, Univ. Medical School, Edinburgh, Scotland).
Microsc. Acta (Germany), vol.87, no.3, p.329-33 (May 1983).
A simple apparatus for the processing of biological specimens for electron microscopy is described. It comprises a fluid exchange chamber with associated reservoir. By carrying out all specimen processing from fixation to embedding in the exchange chamber and infiltrating the dehydrating and embedding mediums progressively, the handling and osmotic stresses associated with standard step processing are minimised. (24 refs.)

104148 Determination of ^{18}O trapping in X-irradiated amino acids by means of nuclear reactions. C.Wiezorek (Inst. fur Strahlenbiologie, Univ. Munster, Munster, Germany).
Radiat. Res. (USA), vol.95, no.1, p.15-23 (July 1983).
Nuclear reactions have been used for the quantitative study of X-irradiation-induced binding of the stable oxygen isotope ^{18}O by several amino acids in the dry state. The measurements demonstrate that the new method is a powerful tool for investigating radical yields. (9 refs.)

104149 In vivo one-dimensional imaging of phosphorus metabolites by phosphorus-31 nuclear magnetic resonance. J.C.Haselgrove, V.H.Subramanian, J.S.Leigh,Jr., L.Gyulai, B.Chance (Dept. of Biochem. & Biophys., Univ. of Pennsylvania, Philadelphia, PA, USA).
Science (USA), vol.220, no.4602, p.1170-3 (10 June 1983).
A phosphorus-31 nuclear magnetic resonance imaging technique has been used to obtain information on phosphorus metabolites from different spatial regions of tissues in vivo. The technique for selection of planes through the tissue is based on phase-encoding of spin echoes and was used to obtain one-dimensional discrimination of phosphorus-31 spectra from different parts of the tissue simultaneously. Specimens were resolved into 16 distinct slices and a signal-to-noise of about 20 to 1 was obtained in $^1/_2$ hour. Results are presented for phantoms, rat legs, and gerbil heads. (12 refs.)

104150 A pulsed-wire spirometer using sing-around method. T.Nemoto, T.Togawa (Inst. for Medical & Dental Engng., Tokyo Medical & Dental Univ., Tokyo, Japan).
Trans. Soc. Instrum. & Control Eng. (Japan), vol.19, no.4, p.314-18 (April 1983). In Japanese.
A pulsed-wire gas flowmeter using a sing-around system and a constant temperature heating method was developed for the spirometry with a wide range of flow rate. A wire located at the upstream is heated by a pulse current and travelled heated air sensed by the other wire. The sensed signal triggers the next pulse current so that the system can selfoscillate. The repetitive pulse

period is determined by the travelling time of heated air from the heated-wire to sensor-wire. The current of pulsed-wire is electronically controlled so that heating wire is kept at constant temperature. (7 refs.)

104151 An animal biological application of neutron radiography: study of rat bone tissue compared with standard radiography and histology. B.Graf, J.Le Gall, G.Renard, A.Laporte.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.533-41
Bone tissue appears to be a suitable material for comparative study using radiography and neutrography. Osseous tissue is composed of a mineral phase and an organic phase. So, in order to obtain a sound basis for the interpretation of neutrographic documents, the authors have separated the two osseous phases and performed both radiographies and neutrographies on the same samples. Neutrography is complementary to radiography for the study of bone. The information obtained from these two techniques is different except when the structures studies are rich in both mineral and light elements. However, neutrography cannot be used in vivo, it must be reserved for biological purposes concerning animals or human specimens from autopsy or surgical excision. (18 refs.)

104152 Neutron radiography of osteopetrotic rat. B.Graf, G.Renard, J.Le Gall, A.Laporte.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.543-53
The osteopetrotic disease is characterized by bone and cartilage tissue coexistence in the medullary space of long bones. The first description was given by H. Albers-Schonberg (1907) in the human race. The authors have studied 'congenital osteopetrosis' of 'op' rats. This disease appeared as a spontaneous mutation in Fatty/ORL and was found recessive and autosomal. This disease is suitable for neutrongraphical and radiographical studies because its appears, with optical examination, composed by two kinds of components: one is made up with calcium salts, radiopaque, the other is made up with glycoproteins and glucosaminoglycans substances neutropaque. Comparing radiography, neutrography and histology, the authors show the evolution of the 'osteopetrotic disease' and the healing of the ill rats by a single injection of bone marrow from normal animals according to G. Milhaud's protocol (1973). (8 refs.)

104153 Fast neutron imaging by cellulose nitrate foils [biological application]. E.Duhmke, L.Greim (Radiological Clinic, Univ. of Kiel, Kiel, Germany).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.565-71
Fast neutrons show sufficient penetration to test thick hydrogen containing objects. Neutron radiography can be done by track etch foil methods, which detects recoil nuclei especially protons. The imaging process has been studied in respect to optimal etching conditions, sensitivity and dose-density relations. A multifoil imaging system is proposed, which allows to lower the necessary neutron dose, suppresses artifacts and expands the attainable density range. With this system a good sharpness can be achieved; this has also been shown by comparison of the modulation transfer function with those of different X-ray imaging systems. (6 refs.)

104154 A neutron radiography technique for studying young roots growing in soil. R.G.Struss (Ames Lab., Iowa State Univ., Ames, IA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.581-90
An indirect technique for taking neutron radiographs using indium collector foils has been used to study seed germination and root growth in soils. This paper describes the work done to develop this technique for in situ studies to replace destructive sampling techniques. Plants grown in loamy sand soil wetted to 9% volumetric water content in aluminum boxes of 2.5 and 5 cm thickness were photographed with this technique. An indium collector plate attached to the back of the box produced a transfer screen during exposure in the neutron beam which was subsequently placed in direct contact with photographic film to produce an image of the plant roots. The resulting indirect images were useful in measurements of root elongation, seed germination, compacted soil surface penetration, and rate of growth, with resolution of roots at about 0.3 mm size being obtained in low moisture soil conditions. Serial neutron radiographs of the same plant allowed sequential studies of root systems that had never been possible prior to development of this technique. (no refs.)

104155 Analysis of cardiac transmembrane action potentials with parallel microprocessors. J.M.Jenkins (Univ. of Michigan, Ann Arbor, MI, USA), D.-L.Klein, R.E.Ten Eick.
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.259-62
A dual microcomputer system has been developed for automating the analysis of cardiac transmembrane action potentials. This system consists of two microcomputers and supporting function modules which digitize, detect, analyze, and plot the transmembrane action potentials of a cardiac cell impaled with a microelectrode. The action potentials are digitized at two sampling rates for computer processing. A sampling rate of 10 kHz is used to obtain the rapid, initial upstroke, while a rate of 100 Hz is used to obtain the slower repolarization phase. The action potentials are characterized by graphic displays using the derived measurements. The system measures the resting potential, amplitude, $dV/dt_{\max}$ and time for 50%, 70% and 95% repolarization of the action potential. (4 refs.)

104156 A digital imaging of myocardial metabolism by multiwire proportional chamber: an alternative to autoradiography. P.Camici, R.Bellazzini, G.Coppini, G.Valli, D.Levantesi, M.G.Trivella, G.Pelosi, L.Taddei, M.Marzilli, A.L'Abbate (Univ. of Pisa, Pisa, Italy).
Computers in Cardiology. Ninth Meeting of Computers in Cardiology, Seattle, WA, USA, 12-15 Oct. 1982 (Silver Spring, MD, USA: IEEE Computer Society Press 1983), p.263-5
A new digital imaging procedure for the study of tracer distribution in the experimental animal is proposed. Regional myocardial content of ^{3}H-deoxyglucose, a tracer of glucose metabolism, was assessed by a specially designed MultiWire Proportional Chamber (MWPC) that acts as a position sensitive radioactivity detector. The obtained digital map was processed by a computer procedure in order to obtain the tracer content in different regions and layers of the heart. (3 refs.)

(for relations of gravity observations to tectonics and isostasy, see 91.45 Physics of plate tectonics)

104157 Time and latitude results of observations made at Merate Observatory with the astrolabe for the year 1982. L.Buffoni, F.Carta, F.Chlistovsky, A.Manara, F.Mazzoleni (Osservatorio Astron. di Milano-Merate, Milano-Merate, Italy).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.43-6 (July 1983).
Results of observations made with the astrolabe Danjon OPL no.32 are given. The results are in the FK4 system. (4 refs.)

104158 The geodesic inverse problem. B.R.Bowring.
Bull. Geod. (France), vol.57, no.2, p.109-20 (1983).
Various ways of solving the longitude equation of the inverse solution for the geodesic on the reference ellipsoid are examined, and a special development is given to deal with the nearly antipodal situation. (6 refs.)

104159 On filtering and compressing LAGEOS laser range data. E.G.Masters, A.Stolz, B.Hirsch (School of Surveying, Univ. of New South Wales, Kensington, Australia).
Bull. Geod. (France), vol.57, no.2, p.121-30 (1983).
A method of compressing LAGEOS laser range measurements into normal points is described. First, the raw range measurements are screened, on a pass-by-pass basis, by a filter which utilizes the fact that the range varies with time very nearly like a quadratic curve. Second, the time series of the filtered range data over each pass is divided into small segments, typically of 150 s duration. Third, each separate segment is modelled by a unique low-order Chebyshev polynomial, typically of order four. Fourth, the polynomial is interpolated at some instant, typically that corresponding to the mean time of the segment, to yield the normal point. Baseline measurements across Australia obtained from full rate data and from data compressed into 150 s normal points, agree to within the measurement error. These differences are mainly due to the effects of data distribution and pass geometry. Computer costs are substantially reduced. (10 refs.)

104160 Numerical calculation of covariances between area means. O.L.Colombo (Geodesy Dept., Tech. Univ. of Delft, Delft, Netherlands).
Bull. Geod. (France), vol.57, no.2, p.131-7 (1983).
When area means are given on a regular grid, their covariance functions, needed in least squares collocation to estimate quantities statistically related to the data, can be calculated as accurately as desired and very efficiently in the form of a Fourier series truncated at a suitably high frequency. (9 refs.)

104161 An efficient short-arc orbit computation. J.Kouba (Earth Phys. Branch, Dept. of Energy, Mines & Resources, Ottawa, Canada).
Bull. Geod. (France), vol.57, no.2, p.138-45 (1983).
Short-arc orbit computations by numerical or analytical integration of equations of motion traditionally utilized in geodetic and geodynamic satellite positioning are relatively involved and computationally expensive. However, short-arc orbits can be evaluated more efficiently by means of least squares polynomial approximations. Such orbit computations do not significantly increase the computation time when compared to widely used semi-short-arc techniques which utilize externally generated orbits. The sufficiently high-degree polynomial approximation of the second time derivatives $\ddot{x}$, $\ddot{y}$ and $\ddot{z}$ evaluated from a gravitational potential model at regular (two-minute) intervals and averaged initial conditions (position and velocity vectors at the beginning, the middle and the end of a pass) reproduces the US Defense Mapping Agency precise ephemeris of the Navy Navigation Satellites (NNSS) to about 5 cm RMS in each coordinate. To achieve this level of orbit shape resolution for NNSS satellites, the gravitational potential model should not be truncated at less than degree and order 10. (16 refs.)

104162 Lateral resection in three dimensions. B.R.Bowring.
Bull. Geod. (France), vol.57, no.2, p.195-7 (1983).
An equation is developed to obtain the azimuths to the known observed points in space, thus reducing the solution to one of intersection. (1 ref.)

104163 The introduction of the IAU 1980 nutation theory in the computation of the Earth Rotation Parameters by the Bureau International de l'Heure. N.Capitaine, M.Feissel (Bur. Internat. de l'Heure, Paris, France).
Bull. Geod. (France), vol.57, no.2, p.198-206 (1983).
The status of nutation theory in the computation of the Earth Rotation Parameters from the different observational techniques is reviewed. The impact on the combined solution of the Bureau International de l'Heure is evaluated. In view of the improvement brought by the IAU 1980 Nutation Theory, its introduction in the BIH publications, without waiting for the adoption by the astronomical ephemerides (1984 Jan. 1) is decided. (13 refs.)

104164 On the indirect influence of the planets on nutation. I. Effects of planetary perturbations in lunar orbit. J.Vondrak (Astron. Inst., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.184-90 (June 1983).
The nutation terms produced by planetary perturbations in the lunar orbit are derived. All the perturbations greater than 0.01″ in angular position and 0.0001″ in the sine parallax of the Moon were considered. The total effect in nutation is found to be of the order of 10^{-4} seconds of arc thus being several times smaller than the direct influence of the planets, derived recently by the author. (8 refs.)

104165 The Indian Ocean gravity low: evidence for an isostatically uncompensated depression in the upper mantle. S.M.Ihnen, J.H.Whitcomb (Cooperative Inst. for Res. in Environmental Sci., Univ. of Colorado, Boulder, CO, USA).
Geophys. Res. Lett. (USA), vol.10, no.6, p.421-3 (June 1983).
The broad gravity low in the equatorial Indian Ocean south of Sri Lanka is the largest and most striking feature in the gravitational field. The most negative long-wavelength free-air gravity anomalies are found there and the sea surface (geoid) lies more than 100 meters below the best fitting ellipsoid. The authors propose a model of the lithosphere and upper mantle which accurately predicts the observed free-air gravity and geoid elevation. The crust south of India currently floats as much as 600 meters lower than would be expected if the region were isostatically compensated. This residual depression of the crust is apparently confirmed by the observations of ocean depth. An uncompensated depression is consistent with the downgoing arm of a convection cell, and also with the presence of a mechanical wake left in the upper mantle behind India as it traveled toward Asia. (16 refs.)

104166 Chandler wobble and frequency dependence of Q_μ of the Earth's mantle. S.M.Molodenskiy, V.N.Zharkov (O.Yu. Schmidt Inst. of Phys. of Earth, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.4, p.245-54 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.4 (1982).
A rigorous derivation is given for the period of the Chandler wobble independent of any oscillation of the nonuniform liquid core. The contribution to the Chandler period due to the anelasticity of the Earth's mantle is examined. A hypothesis is studied according to which the anelasticity of the mantle determining the attenuation of small-amplitude oscillations may be described by transient creep. The question of the frequency dependence of the mechanical energy factor Q_μ of the mantle in the period range of from tens of seconds to a year is studied. (29 refs.)

104167 Fourier analogy in inverse problems of gravimetry for several 'petroleum' and 'planetary' density models. A.S.Margulis, V.M.Novoselitskiy (All Union Sci. Res. Inst. for Geological Petroleum Exploration, Min. of Geology, USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.4, p.289-97 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.4 (1982).
Density changes throughout an external gravity field in layers bounded by concentric spheres or horizontal planes are considered. (32 refs.)

104168 Regional deformation of the Earth model for the San Diego region, California. R.A.Snay, M.W.Cline, E.L.Timmerman (Nat. Ocean Survey, NOAA, Rockville, MD, USA).
J. Geophys. Res. (USA), vol.88, no.B6, p.5009-24 (10 June 1983).
A mathematical model for historical horizontal crustal deformation is presented for the southern California region that extends northward from Mexico for approximately 100 km to 33.5°N latitude. Model parameters are estimated from triangulation, trilateration, and astronomic azimuth data observed during the past century. Also geologic and seismic data indirectly participate in specifying the model. The model relates crustal deformation to the episodic movement experienced during large earthquakes ($M \geq 6$), secular slip rates on geologic and secular strain rates over large geographic areas. The episodic movement is modeled in accordance with the theory of dislocation in an elastic halfspace. For the secular motion the modeled region is partitioned into a mosaic of districts that are allowed to individually translate, rotate, and homogeneously deform as a linear function of time. (40 refs.)

104169 The multiple-frequency Chandler wobble. C.Pan (Hunter Geophys., Mountain View, CA, USA).
J. Phys. Earth (Japan), vol.30, no.5, p.389-419 (1982).
The problem of the excitation and damping of the Chandler wobble is reviewed and the conventional models analyzed. Using an axially near-symmetric and slightly triaxial Earth model, a solution of the Liouville equation reveals that the Chandler wobble has multiple frequency and is rather a quasi-permanent phenomenon in the Earth. After the introduction of the anelasticity of the mantle into the model, the Chandler wobble is found to be a combination of the Kelvin-Voigt and Maxwell oscillations with the former mechanism dominating the motion. The multiple-frequency model explains the Chandler amplitude and frequency variations as well as the persistence of the wobble beyond the damping relaxation time predicted by the single-frequency model. (64 refs.)

104170 Control surveys. J.G.Gergen, C.T.Whalen (Nat. Ocean Service, NOAA, Rockville, MD, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.523-8 (April 1983).
Reviews horizontal control, vertical control, and astronomical position determinations. (89 refs.)

Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.537-43 (April 1983).
Reviews progress in United States gravimetry during the period 1979-82. A representative sampling of important literature published during the period is included. (38 refs.)

104172 Earth tides. C.C.Goad (Nat. Ocean Service, NOAA, Rockville, MD, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.544-6 (April 1983).
Reviews ocean tide models, Earth rotation, Love numbers, load deformation, tidal sensitive measurements, Green's functions, tiltmeter observations, absolute gravity meters, satellite orbital elements variation, laser ranging, altimetry, and very long baseline interferometry. (51 refs.)

104173 Geodetic theory. C.Jekeli (Terrestrial Sci. Div., Air Force Geophys. Lab., Hanscom AFB, Bedford, MA, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.547-53 (April 1983).
Reviews developments in least-squares and statistical techniques, geodetic networks and positioning, the geodetic boundary-value problem, gravity field determination using satellite techniques, error analyses, geopotential model, geodynamics and geodetic theory, reference frames, and data management, during the period 1979-82. (73 refs.)

104174 Status of the geopotential. F.J.Lerch (Geodynamics Branch, Goddard Space Flight Center, Greenbelt, MD, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.560-5 (April 1983).
Reviews progress made in modeling the geopotential field during the period 1979-1982. (73 refs.)

104175 Radio interferometry. W.E.Carter (Nat. Ocean Service, NOAA, Rockville, MD, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.565-8 (April 1983).
Reviews developments in very long baseline interferometry and plans for connected element interferometry. (81 refs.)

104176 Polar motion and Earth rotation. B.D.Tapley (Dept. of Aerospace Engng., Univ. of Texas, Austin, TX, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.569-73 (April 1983).
During the period from 1979 through 1982, polar motion and Earth rotation activity centered on the development of new observation techniques and the investigations of the relation between the observed motions and geophysical phenomena. The activity related to these developments, along with the theoretical and interpretative analyses which have been conducted, are summarized. (121 refs.)

104177 Satellite altimetry. J.G.Marsh (Geodynamics Branch, Goddard Space Flight Center, Greenbelt, MD, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.574-80 (April 1983).
Presents a summary of the geodetic applications of altimeter data, precision orbit determination analyses, the status of the instrumentation and the plans for future altimeter missions. (136 refs.)

104178 Satellite positioning. R.W.Hill (Naval Surface Weapons Center, Dahlgren, VA, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.581-4 (April 1983).
Reviews satellite Doppler positioning, the NAVSTAR Global Positioning System, and satellite laser positioning. (88 refs.)

91.25 GEOMAGNETISM AND PALAEOMAGNETISM; GEOELECTRICITY

104179 A practical method for the inversion of magnetotelluric data for a layered Earth. D.Rankin, F.Pascal (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
Geophysics (USA), vol.48, no.6, p.736-44 (June 1983).
A numerical one-dimensional magnetotelluric inversion technique based on the Nabetani-Rankin algorithm for a layered Earth is presented and illustrated with a noise-free theoretical model and two examples with real field data. (9 refs.)

104180 A comparison of adjustment procedures for leveling aeromagnetic survey data. A.A.Green (Div. of Mineral Phys., CSIRO, North Ryde, NSW, Australia).
Geophysics (USA), vol.48, no.6, p.745-53 (June 1983).
Two techniques for leveling aeromagnetic survey data are compared. The first estimates a set of values for the magnetic intensity at each flight-line/tie-line intersection point. The procedure (a least-squares method) is equivalent to the older manual loop closure methods used for magnetic, gravimetric, and geodetic surveying. The second method involves the fitting of polynomials to the observed flight-line/tie-line intersection errors along each line in the survey. In the analysis of two surveys the least-squares method was found to be superior as a leveling procedure. (9 refs.)

104181 Werner deconvolution for automated magnetic interpretation and its refinement using Marquardt's inverse modeling. C.C.Ku, J.A.Sharp (Aero Service Div., Western Geophys. Co. of America, Houston, TX, USA).
Geophysics (USA), vol.48, no.6, p.754-74 (June 1983).
Presents a deconvolution for automated magnetic interpretation based on Werner's (1953) simplified thin-dike assumption which leads to the linearization of complex nonlinear magnetic problems. The usefulness of the method is expanded by the fact that the horizontal gradient of the total field caused by the edge of a thin interface body is equivalent to the total field from a thin dike. Statistical decision, numerical iteration, and a seven-point operator are used to improve approximations of susceptibility, dip, depth, and horizontal location of the source. (11 refs.)

104182 Use of the resistivity method in geological mapping-case histories from Raniganj Coalfield, India. R.K.Verma, T.K.Bandyopadhyay (Indian School of Mines, Dhanbad, Bihar, India).
Geophys. Prospect. (Netherlands), vol.31, no.3, p.490-507 (June 1983).
The effectiveness of the electrical resistivity method is studied using various configurations with different spacings over the Southern Boundary Fault in the northwestern part, and across a dolerite dyke named 'Salma dyke' in the central part, of the Raniganj Coalfield, India. The delineation of the fault and the dyke is made possible with this method under differential tropical weathering conditions. Geoelectric sections across the fault and the dyke are prepared on the basis of Schlumberger sounding results. In profiling, Wenner, two-electrode, half-Schlumberger and part of Al-Chalabi's (1969) configurations were applied over the Southern Boundary Fault. Across the dyke, alpha-, beta-, and gamma-Wenner, Schlumberger, half-Schlumberger and two-electrode configurations were employed. Azimuthal two-electrode sounding is also studied over the fault. (15 refs.)

104183 Electromagnetic sounding near a large square loop source of current. M.Poddar (Nat. Geophys. Res. Inst., Hyderabad, India).
Geophys. Prospect. (Netherlands), vol.31, no.3, p.508-23 (June 1983).
An electromagnetic sounding experiment with a large square loop as source was carried out on the dried-up bed of a water reservoir near the town of Dharmavaram in Andhra Pradesh. The sounding was performed in both geometric and parametric modes, and involved measurements of phase as well as amplitude of the vertical magnetic field inside and outside the loop. The six-frequency EM system used for the experiment appears to be a workable system for electromagnetic sounding. The results of the experiment more or less confirm the conclusions from theoretical modeling. (9 refs.)

104184 VLF survey of the weathered layer in southern India. M.Poddar, B.S.Rathor (Nat. Geophys. Res. Inst., Hyderabad, India).
Geophys. Prospect. (Netherlands), vol.31, no.3, p.524-37 (June 1983).
The electrical properties of the weathered layer were investigated by means of Geonics VLF-EM 16/16R equipment in two areas of the Andhra Pradesh State for groundwater prospecting. The resistivity and thickness of the weathered layer are found to be variable even over a small survey area. In the area underlain by Precambrian granite-gneiss, most of the recorded VLF-EM anomalies are caused by variations in the resistivity of the weathered layer. Changes in thickness are well reflected in the VLF-EMR curves. The second area is underlain by Cretaceous basalts and dolerites. Quantitative interpretation of the VLF-EMR data with a simple one-dimensional model yields considerable detail about the weathered layer. The field studies suggest that the VLF-EMR method can be used as a fast and inexpensive tool for mapping of the weathered layer in tropical regions with hard rock geology. (14 refs.)

104185 Spectral analysis of long-period variations of the magnetotelluric field on the southeast Siberian Plate. V.Yu.Semenov, V.A.Kuznetsov, B.A.Okulesskiy (Shirshov Inst. of Oceanology, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.78-81 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
Spectral analysis methods were used to develop an algorithm for processing data on long-period variations in the magnetotelluric field. A computer program developed from this algorithm was tested on measurements of the variations in the magnetotelluric field over the southeast Siberian Platform. Oriented and auxiliary impedances are derived. An effective apparent-resistance curve is plotted. (8 refs.)

104186 Electromagnetic investigations of secular variation anomalies in the Ural region. A.G.Krasnobayeva, V.A.Shapiro (Inst. of Geophys., Acad. of Sci., Sverdlovsk, USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.82-7 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
Calculations and studies of three secular variation anomalies in the Urals are presented. The Manchazh anomaly is caused by a rocky body of high residual magnetization. In the Butkino and Bashkir anomalies not more than 10% to 20% of the anomalous variation may be ascribed to field induction from an external source, and most of the variation is clearly related to current variations in the Earth. (10 refs.)

104187 Analytical description of the secular variations of the geomagnetic field and the rate of rotation of the Earth. S.I.Braginskiy (Inst. of Phys. of Earth, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.88-94 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
An analytical approximation of the data on the variations in the length of the day over a period of 10 years is derived in the form of a sum of the trend and a number of transient oscillations. In a similar form, with the same fundamental frequency of oscillation, an analytical approximation is derived for data on the variations of the Gaussian coefficients of the geomagnetic field for the 20th century. The role of field variations in the theory of geomagnetism is discussed. (34 refs.)

104188 Vertical component of the geoelectric field in high latitudes and magnetosphere processes. O.I.Bandilet, S.P.Chernysheva, V.M.Sheftel (Rostov Civil Engng. Inst., Rostov, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.213-16 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
Variation of the vertical component of the geoelectric field (E_z) near the Earth's surface in the auroral and subauroral zones are presented. Space-time E_z distribution patterns are defined for high latitudes, the effect of magnetospheric substorms on E_z at high latitude is analyzed and its possible mechanisms discussed. (18 refs.)

104189 Structure of ELF electromagnetic fields in the Arctic Ocean. A.V.Gusev, A.P.Polykov, N.I.Uspenskiy, M.B.Yartsev (Arctic & Antarctic Inst., State Committee on Hydrometeorology USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.228-32 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
A study has been made of the natural ELF electromagnetic fields in the Arctic Ocean. The experimental apparatus, the experimental procedure, and the data analysis are described. The results confirm the hypothesis that these fields result primarily from the excitation of an Earth-ionosphere waveguide. The propagation characteristics of ELF electromagnetic waves in the ocean are derived and discussed. (7 refs.)

104190 Solar wind velocity and changes in the geomagnetic moment. Yu.D.Kalinin, T.S.Rozanova (L.V. Kirenskii Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.233-5 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The average annual velocities of the solar wind are calculated for the years from 1930 through 1960 from the average annual values of the geomagnetic activity index and the regression equation found by Svalgaard. For the same years, the average annual data from 12 magnetic observatories at various points on the globe are used to calculate the geomagnetic moment M and, separately, its 'external' and 'external' parts (caused by factors respectively within the Earth and outside it). (8 refs.)

104191 Temporal variations in the anomalous magnetic field in the Fergana Valley in 1973-1979 and prediction of the Alay earthquake of 2 November 1978. V.A.Shapiro, K.N.Abdullabekov, M.Yu.Muminov, T.Kh.Khadzhiyev, E.B.Berdaliyev (Inst. of Geophys., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.236-40 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The changes in the anomalous magnetic field near the city of Andizhan which were used in the prediction of the Alay earthquake of 2 November 1978 ($M=7.0$) are discussed. The anomaly in the magnetic field coincided in time with an anomaly of the vertical motion of the Earth's crust. It is suggested that the source of the anomalous variation is a change in the electric current system in the lithosphere. (20 refs.)

104192 Screening properties of the mantle and extrapolation of the variation field to the core-mantle boundary. G.I.Kolomiytseva (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.241-4 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The screening properties of a conducting mantle are studied. The phase lag and the amplitude damping are derived as functions of the period of the variations for various spatial harmonics. These results can be used to extrapolate the secular variation field, $F(T)$, to the core-mantle boundary with the help of the known coefficients in the expansion of the field $F(T)$ in spherical harmonics. (20 refs.)

104193 Devonian dikes from north central Newfoundland: a radiometric-paleomagnetic study. P.H.Reynolds (Dept. of Phys. & Geology, Dalhousie Univ., Halifax, Nova Scotia, Canada), G.S.Murthy.
Geophys. Res. Lett. (USA), vol.10, no.6, p.432-5 (June 1983).
$^{40}Ar/^{39}Ar$ age spectra have been obtained for biotites and hornblendes representing a suite of diabase dikes from the northern part of Newfoundland's Gander Zone. A primary apparent age of 375±10 Ma is suggested, a value probably very close to the age of intrusion. A number of the age spectra are discordant; this perhaps results from a disturbing 'event' ~180 Ma ago. Magnetic analysis of the dike swarm has yielded four paleopoles; three of these magnetizations appear to be carried by multi-domain magnetite, the other by hematite. If the magnetite magnetizations are primary, they possibly reflect a period of aberrant geomagnetic field behaviour at about the time given above. If the hematite magnetization is primary, the data can be interpreted in terms of the displaced terrain model of Kent and Opdyke,. (26 refs.)

104194 On magnetotelluric sounding of conducting layers in the Earth's crust and upper mantle. M.N.Berdichevskiy, V.I.Dmitriyev, I.S.Barashkov, N.A.Mershchikova, V.M.Kobzova (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.7, p.520-30 (1982).
The resolving capability of deep magnetotelluric (MT) sounding of local conducting layers in the Earth's crust and upper mantle is analyzed. It is shown that the crystalline rocks shield local conducting layers and that the resolving capability of the MT-sounding may be much lower than in a one-dimensional model. From this viewpoint, the most favorable for deep MT-sounding are highs on the basement, massifs containing effusive formations, and platforms with high-resistivity sedimentary covers. (20 refs.)

104195 Deep magnetotelluric profiling using the vertical component of geomagnetic variations. A.P.Bondarenko (S.I. Subbotin Inst. of Geophys., Acad. of Sci., Ukrainian SSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.7, p.531-7 (1982).
The results of testing a version of magnetotelluric profiling from S_q-variations on the basis of impedance determinations with a coefficient of the apparent horizontal conductivity inhomogeneity are presented. The results are compared with a seismological cross section and with the depth to a highly-conductive boundary in the mantle derived from geomagnetic profiling data. (16 refs.)

104196 The use of Walsh filters in geoelectric investigations. B.L.Pivovarov (Dept. of Geology, Moscow State Univ., Moscow, USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.7, p.538-43 (1982).
An examination is made of linear numerical systems whose frequency responses are Walsh functions. Modulated discrete sequences (MDS) are defined. The theorem of optimum Walsh filters coordinated with MDS is proved, and its consequences in relation to the problem of the suppression of regular electromagnetic noise are examined. The results of numerical simulation are given. (4 refs.)

104197 Electromagnetic geophysics and global tectonics. D.I.Gough (Inst. of Earth & Planetary Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
J. Geophys. Res. (USA), vol.88, no.B4, p.3367-77 (10 April 1983). [received: Aug. 1983] (Anton L. Hales Symposium on 'Some Recent Advances in Geophysics', Dallas, TX, USA, 5-6 Oct. 1981).
In this review the author discusses conductivity-depth profiles obtained by four-electrode resistivity sounding of the continental lithosphere and magnetotelluric sounding of the oceanic lithosphere. Magnetometer arrays yield poor depth resolution but are very effective in discovery and mapping of highly conductive structures. Results from magnetometer arrays are discussed in greater detail both because the author's own work has been largely in this area and because some interesting ideas in global tectonics have arisen from this type of study. (40 refs.)

104198 Investigation of a Vine-Matthews magnetic lineation from a submersible: the source and character of marine magnetic anomalies. K.C.Macdonald, S.P.Miller, B.P.Luyendyk, T.M.Atwater (Dept. of Geological Sci. & Marine Sci. Inst., Univ. of California, Santa Barbara, CA, USA), L.Shure.
J. Geophys. Res. (USA), vol.88, no.B4, p.3403-18 (10 April 1983). [received: Aug. 1983]
Reports the first attempt to map directly the boundary of a Vine-Matthews magnetic stripe on the seafloor. The objectives are to study the processes of oceanic crustal accretion as recorded in the reversal transition zone and to investigate the formation of the magnetic source of Vine-Matthews magnetic anomalies. The deep-tow and ALVIN-based magnetic studies focus on the Matuyama/Brunhes reversal transition on the flanks of the East Pacific Rise near 21°N. While the sea level magnetic anomalies are less than average in clarity for the East Pacific Rise, a 'three-dimensional' inversion of deep-tow data reveals a sharp, strike-linear polarity transition less than 1.8 km wide. The measurements show that nearly every magnetic target has the correct polarity. The mechanisms responsible responsible for the formation of new oceanic crust at mid-ocean ridges is discussed in the light of these new observations. (77 refs.)

104199 Paleomagnetism of a polarity transition in the Lower (?) Triassic Chugwater Formation, Wyoming. E.Herrero-Bervera, C.E.Helsley (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3506-22 (10 April 1983). [received: Aug. 1983]
A total of 156 oriented specimens, taken at stratigraphic intervals of 3 to 20 cm, have been collected from the Red Peak Member of the Chugwater Formation at three localities approximately 25 km southeast of Dubois, Wyoming. The stratigraphic interval containing the polarity transition in the remanent magnetic field is about 1.0 m. The section sampled is divided into five intensity periods: two periods recording the dipolar field, one recording a dipolar field of decreasing intensity, one recording a dipolar field of increasing intensity, and a period of low intensity recording the field present during the 180° directional swing. A virtual geomagnetic pole path obtained for a N→R polarity transition makes a fairly smooth transit, with the path confined to a sector of longitude between 85°W and 110°E. The reversal's onset is first indicated by a slow movement of the VGP across northern latitudes. (55 refs.)

104200 Paleomagnetism of Mesozoic and Tertiary rocks from East El Oweinat area, southwest, Egypt. A.Gouda Hussain, Y.Aziz (Helwan Inst. of Astron. & Geophys., Helwan, Cairo, Egypt).
J. Geophys. Res. (USA), vol.88, no.B4, p.3523-9 (10 April 1983). [received: Aug. 1983]
Ten sites from alkali syenite at East El Oweinat (23.2°N, 29.5°E) yield a stable mean direction of magnetization resulting in a pole at 67.8°N. 268.8°E with $A_{95}=8.6°$. This pole position agrees with the other Upper Cretaceous pole positions of Africa. From seven sites from Upper Cretaceous Nubian

sandstone at East El Oweinat a mean direction was obtained. The paleopole positions of East El Oweinat rocks confirm the apparent polar wander path of Africa established in previous papers. (19 refs.)

104201 On the theory of electromagnetic induction in the Earth by ocean currents. A.D.Chave (Inst. of Geophys. & Planetary Phys., Scripps Inst. of Oceanography, Univ. of California, La Jolla, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3531-42 (10 April 1983). [received: Aug. 1983]
The theory of electromagnetic induction is extended to the case where the driving electric currents must be considered explicitly. Differential equations for independent poloidal magnetic (PM) and toroidal magnetic (TM) modes are derived directly from the governing quasistatic form of the Maxwell equations. They are applied to induction by motional source fields in the ocean by deriving Green functions for the two modes in a constant depth ocean. PM and TM modes are shown to behave in very different ways as a function both of the ocean velocity field dynamics and of the electrical conductivity structure of the Earth. (25 refs.)

104202 Geomagnetic anomalies over the Fossa Magna region in central Japan. Y.Ishikawa, T.Yukutake (Earthquake Res. Inst., Univ. of Tokyo, Tokyo, Japan).
J. Geomagn. & Geoelectr. (Japan), vol.34, no.10, p.551-70 (1982).
Total intensity data acquired by aeromagnetic surveys are decomposed into vector components, following a procedure proposed by Lourenco and Morrison (1973). It is revealed that the Fossa Magna is a magnetic region. Intense magnetic anomalies are situated inside the region, and no conspicuous anomalies are outside. The distributions are discussed together with their origins. The boundaries of the Fossa Magna correspond to the boundaries of the magnetic region. (23 refs.)

104203 An electromagnetic scale model study of the Rheingraben anomaly. V.Ramaswamy (Oil & Natural Gas Comm., Nazira, India), H.W.Dosso, R.Winter.
J. Geomagn. & Geoelectr. (Japan), vol.35, no.1, p.17-27 (1983).
The behaviour of time-varying geomagnetic fields in the Rheinegraben region is investigated using a laboratory scale model. The two dimensional geophysical model proposed by Winter (1973, 1974), which consists of a thin sedimentary layer with nonuniform conductivity and a series of subsurface layers, is modelled in the laboratory. The study indicates good agreement between the scale model results and the field station observations. The model results have further established that the behavior of the surface geomagnetic fields observed in the Rhinegraben region is strongly influenced both by the near-surface sedimentary layer as well as by a highly conducting layer in the upper mantle. (15 refs.)

104204 Magnetic anomalies as a reference for ground-speed and map-matching navigation. C.Tyren (Lund Inst. of Technol., Lund, Sweden).
J. Navig. (GB), vol.35, no.2, p.242-54 (May 1982). [received: July 1983]
The Earth's magnetic field provides a directional reference of almost world-wide usable coverage. The author examines the use of the magnetic field for ground referenced motion and position measurements. (3 refs.)

104205 Detailed geomagnetic studies of the rift zone in the south of the Red Sea. A.A.Shreyder, V.I.Trukhin, V.A.Sychev, N.A.Rimskiy-Korsakov (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.325-30 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
Detailed geomagnetic and geomorphological studies, carried out by the R/V Akvanavt, coupled with data obtained by side-scanning sonar and high-frequency profiles from the towed Zvuk-4 vehicle, plus the results of visual observations of the sea bottom from the Pisces submersible, have shown that the spreading axis is divided into segments, whose strike (330°) differs from the overall strike (310°) of the axial magnetic anomaly. In the study area, the segments are about 1 km long, and the transform displacements are 0.5 km. Calculations on a model have shown that the spreading is asymmetric: during the Brunhes epoch, the accretion rate of the African Plate was 6 mm/yr, and that of the Arabian Plate, 7 mm/yr. Earlier, it has been 9 and 11 mm/yr, respectively. (10 refs.)

104206 The magnetic characteristics of the oceanic crust in the Heezen Fracture Zone. T.I.Lin'kova, G.L.Kashinets, A.M.Gorodnitskiy, M.I.Raykevich (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.331-6 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
Petrographic and magnetic studies were carried out on samples of crustal rocks from the Heezen (Eltanin) Fracture Zone in the southeastern Pacific. The data obtained showed the presence of magnetically active layers and allowed their comparison with observed magnetic anomalies. The positive anomaly above the uplifted southern margin of the zone is the result of superposition of fields, where the magnetically-active layers consist (from the top down) of basalts, dolerites, ultramafics, and metamorphic rocks. The metamorphic rocks exhibit a large induced magnetization which may be the cause of the observed magnetic anomalies. (5 refs.)

104207 Acquisition of long wavelength magnetic anomalies pre-dates continental drift. A.Galdeano (Inst. de Phys. du Globe, Univ. Paris, Paris, France).
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.289-92 (July 1983).
Using the low altitude MAGSAT satellite data, NASA recently published a new global magnetic map of anomalies. Using this new accurate map and paleomagnetic reconstruction of Gondwanaland, it is pointed out that long wavelength anomalies were continuous in continents that are presently separated. Thus, continental drift would not significantly affect the geometry of these deep-source anomalies. Accordingly, the magnetization of the rocks responsible for these anomalies should mainly be induced. (19 refs.)

104208 Electromagnetic fields induced in the world's oceans and the spatial distribution of electrical conductivity functions. E.B.Fainberg, B.Sh.Singer, A.V.Kuvshinov (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., Moscow, USSR).
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.293-300 (July 1983).
The results of numerical simulation of electromagnetic fields induced in the world's oceans by solar daily variations are discussed. Some examples of apparent resistivity curves simulated for continental and ocean regions are demonstrated. (14 refs.)

104209 A preliminary geoelectrical model of the Karelian megablock of the Baltic shield. P.Kaikkonen (Dept. of Geophys., Univ. of Oulu, Oulu, Finland), L.L.Vanyan, S.E.Hjelt, A.P.Shilovsky, K.Pajunpaa, P.P.Shilovsky.
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.301-5 (July 1983).
Three groups of electromagnetic data have been considered in order to construct a preliminary geoelectrical depth model of the old basement of the Baltic shield: (i) audiomagnetotelluric data in the period range 1/3700-1/8 s; (ii) magnetotelluric data in the period range 25-1000 s; and (iii) global magnetovariation-sounding data in the period range >6 h. These data sets fit together on a common apparent-resistivity curve, indicating the existence of a unified geoelectrical model. This model does not support the existence of conducting crustal or asthenospheric layers. (16 refs.)

104210 Induction arrows for a buried conducting plate. W.Nienaber, D.Hebert, H.W.Dosso (Dept. of Phys., Univ. of Victoria, Victoria, British Columbia, Canada).
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.306-11 (July 1983).
A scaled electromagnetic analogue model is used to study the behaviour of single station induction arrows over a conducting plate embedded in a homogeneous poorly conducting medium. For a profile crossing the edge of the conducting plate, the in-phase arrow, for all locations, points towards the bulk of the good conductor while the quadrature arrow reverses direction directly over the edge, consistently pointing towards the edge. The results also show that both the in-phase and quadrature arrow lengths are reduced with increasing conductor thickness and depth of burial. The model results are applied to examples of a uniform depth ocean and a conducting sill embedded in a poorly conducting Earth. (15 refs.)

104211 Main field and recent secular variation. L.R.Alldredge (US Geological Survey, Denver, CO, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.599-603 (April 1983).
Reviews data sources, MAGSAT, main field representations, secular variation sources, and studies of anomalies in the period 1979-82. (53 refs.)

104212 Archaeo- and paleosecular variation, and long-term asymmetries of the geomagnetic field. C.E.Barton (Graduate School of Oceanography, Univ. of Rhode Island, Narragansett, RI, USA), R.T.Merrill.
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.603-14 (April 1983).
Summarizes progress made during the years 1979-82 in (i) obtaining records of the geomagnetic secular variation using paleomagnetic techniques, (ii) analysis and modelling of the secular variation, and (iii) the study of asymmetries in the time-averaged field: seen both as departures from the geocentric axial dipole model, and as statistical differences between polarity states. (160 refs.)

104213 Geomagnetic reversals and excursions: their paleomagnetic record and implications for the geodynamo. K.A.Hoffman (Phys. Dept., California Polytech. State Univ., San Luis Obispo, CA, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.614-20 (April 1983).
Reviews palaeomagnetic transition records, field intensities during reversals, reversal duration, transition field geometries, testable models, sources of the transition field, palaeomagnetic excursions, reversals—excursions relationships and dynamo implications. (59 refs.)

104214 Magnetic polarity stratigraphy. L.S.Chan, W.Alvarez (Dept. of Geology & Geophys., Univ. of California, Berkeley, CA, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.620-6 (April 1983).
Reviews studies of pelagic and other deep-sea sediments, continental sediments, magnetostratigraphic nomenclature, and the polarity time scale. (132 refs.)

104215 Geomagnetism of Earth's core. E.R.Benton (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.627-33 (April 1983).
Reviews major highlights in the 1979-82 period: the successful completion of the first global vector magnetic satellite survey of Earth (by MAGSAT); a wealth of important work on the present physical, compositional, thermodynamic and energetic state of the outer core as well as its evolution over geological time; and a revival of interest in the direct extraction from magnetic measurements of the fluid dynamic motions at the top of the core. (109 refs.)

104216 Magnetic anomalies. C.G.A.Harrison (Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.634-43 (April 1983).
Reviews MAGSAT results, and studies of core magnetic field, oceanic basins, and magnetic anomalies in the United States, and magnetic modelling in the period 1979-82. (230 refs.)

104217 Paleomagnetism and the motion of large and small plates. M.O.McWilliams (Geophys. Dept., Stanford Univ., Stanford, CA, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.643-51 (April 1983).
Discusses three major aspects of paleomagnetic research important to the 1978-1982 quadrennial: (1) refinement and application of Cenozoic/Mesozoic apparent polar wander paths (APWP) for the major plates, (2) delineation, displacement, history and assemblage of some of the better-known terranes which comprise the marginal domains of some continents, and (3) development and interpretation of Paleozoic and Precambrian reference APWP. (234 refs.)

104218 Electromagnetic induction studies. J.F.Hermance (Dept. of Geological Sci., Brown Univ., Providence, RI, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.652-65 (April 1983).
Reviews development involving electromagnetic induction studies of the lithosphere and asthenosphere. Activities during the period 1979-82 are emphasized, particularly those of US and Canadian workers. (350 refs.)

91.30 SEISMOLOGY

104219 Earthquake data analysis: an example from Sweden. M.Bath.
Earth-Sci. Rev. (Netherlands), vol.19, no.3, p.181-303 (June 1983).
Methods and results of earthquake data analysis are illustrated by the seismicity of Sweden in the period 1951-1976, summarizing a comprehensive research project for the past five years. Starting from the regional structural properties, methods are given for the evaluation of instrumental and macroseismic observations, including error analysis and source identification. The resulting earthquake distribution is investigated in relation to space (various types of seismicity mapping), time (periodicities) and magnitude (frequency-magnitude and energy-magnitude relations). (149 refs.)

104220 A specific barrier model for the quantitative description of inhomogeneous faulting and the prediction of strong ground motion. I. Description of the model. A.S.Papageorgiou, K.Aki (MIT, Cambridge, MA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.693-722 (June 1983).
Constructs an earthquake source model which provides a complete description of acceleration power spectra of direct body waves. The model is a specific form of the barrier model proposed by Aki et al. (1977). According to this specific barrier model, the fault surface is visualized as composed of an aggregate of circular cracks which represent areas of localized slip, and the strong motion is assumed to be generated by the stationary occurrence of these localized ruptures as the rupture front propagates. The acceleration power spectra of direct S waves are described by their peak value and an effective bandwidth. From these spectra and an estimate of the duration of faulting, measures of strong motion intensity such as r.m.s. and maximum acceleration can be inferred. (49 refs.)

104221 Numerical evaluation of near-field, high-frequency radiation from quasi-dynamic circular faults. M.Campillo (Lab. de Geophys. Interne, IRIGM, Grenoble, France).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.723-34 (June 1983).
Computes the near-field, high-frequency radiation from a circular crack expanding with constant rupture velocity and discusses the characteristics of the stopping phases. The author then introduces rupture velocity jumps in the fracture process. The computed accelerations show the dominant role played by the rupture front kinematics. The high acceleration pulses are associated with sudden changes of the rupture velocity. For a sudden jump (or a sudden stop), there is no theoretical high-frequency limit to the spectral density of acceleration. In order to account for $f_{\max}$, the author introduces a smooth deceleration of the rupture front over a time t′ in place of a sudden stop. (18 refs.)

104222 Three-dimensional ray tracing and the method of principal curvature for geometric spreading. Jia-Ju Lee, C.A.Langston (Dept. of Geosci., Pennsylvania State Univ., University Park, PA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.765-80 (June 1983).
A three-dimensional ray method is used to compute three components of ground motion for complex structures involving curved boundaries. The method of principal curvature is developed to compute geometrical spreading of rays. This method employs phase matching at model interfaces and analysis of the wave front surface metric as the ray propagates throughout the model. Results computed for a two-dimensional canonical basin model with a plane *SH*-wave source are compared. Relaxing the restriction that the incident wave be perpendicular to the basin symmetry axis gives rise to large amplitude vertical and radial motions for incident *SH* waves and large tangential motions for incident *P* waves. (18 refs.)

104223 Spatial attenuation of the *Lg* wave in the central United States. J.J.Dwyer, R.B.Herrmann, O.W.Nuttli (Dept. of Earth & Atmospheric Sci., Saint Louis Univ., Saint Louis, MO, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.781-96 (June 1983).
The spatial attenuation of the *Lg* wave in the central United States is studied in the time domain in the frequency range of 1 to 10 Hz. Bandpassed microearthquake data are used to estimate source spectrum shapes and seismic moments. Incorporating these results with those of Street et al. (1975), the seismic moment-magnitude scaling for the central United States is found. (17 refs.)

104224 Deep intraplate seismicity in the western Sierra Nevada, central California. I.G.Wong, W.U.Savage (Woodward-Clyde Consultants, Walnut Creek, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.797-812 (June 1983).
A microearthquake monitoring program was conducted from 1976 to 1979 in the eastern San Joaquin Valley and Sierran foothills of central California. This program revealed one of the deepest occurrences of intraplate earthquakes observed in the conterminous United States. Earthquakes in the M_L range of approximately 0 to 3.2 were confined to the lower crust of the Sierran block at depths from 12 to 38 km. The distribution of epicenters was diffuse and widespread with some clustering in space and time. Two particularly active areas that were consistent with the historical seismicity record were recognized: an area 15 km south of the town of Madera and an area 15 km south of Mariposa. This occurrence of deep seismicity does not appear to extend farther north along the foothills than Jamestown, although two deep events have been observed near Oroville. Focal mechanisms of these deep crustal earthquakes are discussed. (25 refs.)

104225 Rampart seismic zone of central Alaska. P.Yi-Fa Huang, N.N.Biswas (Geophys. Inst., Univ. of Alaska, Fairbanks, AK, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.813-29 (June 1983).
Describes the characteristics of the Rampart seismic zone by means of the aftershock sequence of the Rampart earthquake ($M_L=6.8$) which occurred in central Alaska on 29 October 1968. The magnitudes of the aftershocks ranged from about 1.6 to 4.4 which yielded a *b* value of 0.96 ± 0.09. The locations of the aftershocks outline a NNE-SSW trending aftershock zone about 50 km long which coincides with the offset of the Kaltag fault from the Victoria Creek fault. Fault plane solutions for a group of selected aftershocks, which occurred over a period of 22 days after the main shock, show simultaneous occurrences of strike-slip and normal faults. A comparison of the trends in seismicity between the neighboring areas is discussed. (21 refs.)

104226 Maximum likelihood estimation of *b* values for magnitude grouped data. B.Bender (US Geological Survey, Denver Federal Center, Denver, CO, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.831-51 (June 1983).
The *b* value estimated by fitting a set of observed earthquake magnitudes to the magnitude-frequency relationship, $\log N(m)=a-bm$, where $N(m)$ = number of earthquakes exceeding magnitude *m*, is correlated with the fitting technique used. A simple form of the grouped data formula is derived and shows the role of interval size and maximum magnitude on the *b* value obtained. The author shows how, given a population value of *b*, to calculate the distribution of the estimated *b* values. The author also derives an a posteriori distribution for the population *b* value, given the magnitudes of an observed set of earthquakes. The distribution of *b* values fitted by various techniques is illustrated. (8 refs.)

104227 A statistical model of the earthquake process. J.Lomnitz-Adler (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.853-62 (June 1983).
A model is presented for the simulation of the statistical features of the earthquake process. An analytical solution is given for a simple case, and a numerical calculation of spatial and stress drop frequency distribution has been carried out. Extensions of the model are discussed. (6 refs.)

104228 Dynamic analysis of a slope failure from the 6 August 1979 Coyote Lake, California, earthquake. R.C.Wilson, D.K.Keefer (US Geological Survey, Menlo Park, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.863-77 (June 1983).
The Coyote Lake, California, earthquake of 6 August 1979 ($M_L=5.7$) provided a rare opportunity to perform a dynamic numerical analysis of a seismically induced slope failure using actual strong-motion records. The earthquake displaced a preexisting slump on the northeast shore of Lake Anderson and formed a fissure 20 m long; offsets of 9 mm vertically and 18 mm horizontally were measured across the fissure. The slump is 9 km northwest of the located epicenter but within 100 m of the mapped trace of the Calaveras fault. Two strong-motion records were written in the vicinity of the slump: Coyote Creek, 5 km to the southeast, and Gilroy #6, 15 km to the southeast. These records combined with field measurements of the slope, estimates of the material properties, and a dynamic numerical model based on the Newmark (1975) analysis of seismic slope stability are used to calculate a predicted displacement for the landslide. (14 refs.)

104229 Partial derivative of Love numbers. S.Okubo (Earthquake Res. Inst., Univ. of Tokyo, Tokyo, Japan), M.Saito.
Bull. Geod. (France), vol.57, no.2, p.167-79 (1983).
Presents a simple formula for the partial derivatives of Love numbers with respect to density, bulk modulus and rigidity without using the Adams-Williamson condition in the liquid core. Partials of the second degree Love numbers are computed for model 1066 A. Love numbers prove to be either completely or virtually independent of the elastic profile within the whole core. Delta-function-like changes occur in Love numbers when the density of the top and bottom layers of the outer core are perturbed. (6 refs.)

104230 Measures of strong ground motion derived from a stochastic source model. E.Faccioli (Dept. of Structural Engng., Politecn. di Milano, Milano, Italy).
Int. J. Soil Dyn. & Earthquake Eng. (GB), vol.2, no.3, p.135-49 (July 1983).
Taking the seismic spectrum of a 'statistical' source model as the point of departure, the author arrives at simple expressions for strong miotion measures of engineering significance. Introducing inelastic attenuation through a frequency dependent *Q*-factor, the following relation is obtained for root-mean-square acceleration $\bar{a}$: $\bar{a}\simeq (M_0/4\pi\partial\beta^3)(\exp(-qR)/R)(k_T{}^{-1}/T_r)^{0.5} k_T{}^3[D_a(\Theta)]^{0.5}$ where M_0 is seismic moment, β is shear-wave velocity, R is distance, $k_T{}^{-1}$ is the correlation time of the model, q is an attenuation parameter, T_r is the rupture duration, and $D_a(\theta)$ is a directivity factor. The basic parameter $K_T{}^{-1}$ is estimated by regressing the Arias intensities of representative accelerograms from Italy and Yugoslavia through the analytical expression derived herein. The regression analysis shows that (a) $k_T{}^{-1}$ scales as $M_0{}^{0.26}$; (b) the ratio $k_T{}^{-1}/T_r$ is virtually independent of M_0 so that $\bar{a}\propto M_0{}^{0.23}$, and (c) the fit is improved when directivity is accounted for. (65 refs.)

104231 Characterization of inclusion through surface strong ground motion. M.Dravinski (Dept. of Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA).
Int. J. Soil Dyn. & Earthquake Eng. (GB), vol.2, no.3, p.150-5 (July 1983).
Steady-state wave motion in a half-space with an elastic inclusion of arbitrary shape subjected to a surface line load is investigated. Material of the half-space and the inclusion is assumed to be linearly elastic, homogeneous, and isotropic. Displacement field is evaluated throughout the elastic media by using a boundary integral method so that the continuity conditions between the half space and the inclusion are satisfied in the mean square-sense. Surface displacement results are presented for an elliptic inclusion of arbitrary orientation. A wide range of parameters in the problem is considered. (15 refs.)

104232 Dynamic interaction of a propagation crack with an oblique fault. P.S.Theocaris, H.G.Georgiadis (Dept. of Theoretical & Appl. Mech., Nat. Tech. Univ. of Athens, Athens, Greece).
Int. J. Soil Dyn. & Earthquake Eng. (GB), vol.2, no.3, p.s161-70 (July 1983).
The behaviour of a fast running crack against an internal oblique fault in a brittle material (polymethylmethacrylate) was investigated by the use of high-speed photography and caustics. This problem is significant in rock mechanics, where the whole failure of the rock mass is often due to such dynamic interaction phenomena during earthquake activities. Interesting effects were disclosed when the rapidly moving crack was approaching the internal fault. The non-homogeneous stress field, which was created by the internal slant crack, forced the main propagating crack to a curved path and, simultaneously, to a deceleration of its velocity and eventually its arrest, as well as the variation of the only effective K_I-stress intensity factor along almost all the field of propagation of the crack. The purpose of this paper is to investigate the conditions which govern the development of such phenomena. (15 refs.)

104233 Mechanism of deformation during cyclic undrained loading of saturated sands. Y.P.Vaid, J.C.Chern (Dept. of Civil Engng., Univ. of British Columbia, Vancouver, Canada).
Int. J. Soil Dyn. & Earthquake Eng. (GB), vol.2, no.3, p.171-7 (July 1983).
Laboratory cyclic loading tests have provided most of the present understanding of the response to saturated sands under earthquake loading. In many cases, however, the interest has centered on relating the resistance to liquefaction to the number of cycles of loading. Few attempts have been made to examine in detail the response within cycles of loading. Such an examination is essential for a fundamental understanding of the processes leading to pore-water pressure and strain development of liquefaction. To satisfy the need for practical applications, a close simulation of the stress condition on soil elements in the field, both prior to and during an earthquake, has been emphasized in all cyclic loading studies. Thus, cyclic triaxial tests on isotropically consolidated samples or cyclic simple shear tests on one-dimensionally consolidated samples have been used to simulate stress conditions below level ground. (13 refs.)

104234 Microseisms in geothermal field exploration. I. M.Ohmi, K.Kaneko, M.Inoue, K.Masunaga (Kumamoto Univ., Kyushu, Japan).
Tech. Rep. Kumamoto Univ. (Japan), vol.31, no.3, p.91-6 (Nov. 1982). In Japanese.
The area around geothermal fields in Kyushu, Japan, was surveyed for microseisms. One to 30 Hz band pick-ups with vertical, north-south, and east-west sensors feeding into an amplifier, data recorder, digital memory and

microcomputer were used. Analysis of the data to eliminate man-made and natural sources of microseisms is described. Examples of this analysis on the data obtained are shown. (3 refs.) *M.O.*

104235 Reflection of spherical seismic waves in elastic layered media. P.M.Krail (Res. Center Annex, Getty Oil Co., Houston, TX, USA), H.Brysk.
Geophysics (USA), vol.48, no.6, p.655-64 (June 1983).
The solution of the elastic wave equation for a plane wave incident on a plane interface has been known since the turn of the century. For reflections from reasonably shallow beds, however, it is necessary to treat the incident wave as spherical rather than plane. The formalism for expressing spherical wavefronts as contour integrals over plane waves goes back to Sommerfield (1909) and Weyl (1919). Brekhovskikh (1960) performed a steepest descent evaluation of the integrals to attain analytic results in the acoustic case. The authors have extended their approach to elastic waves to obtain spherical-wave Zoeppritz coefficients. (15 refs.)

104236 Generalized linear inversion of reflection seismic data. D.A.Cooke, W.A.Schneider (Colorado School of Mines, Golden, CO, USA).
Geophysics (USA), vol.48, no.6, p.665-76 (June 1983).
Generalized linear inversion is applied to synthetic and real seismic data sets with the objective of obtaining an impedance profile as a function of time. The impedances solved for are parameterized in a manner that describes the unknown Earth using fewer variables than previous seismic generalized linear inversion techniques. The method of generalized linear inversion is designed to improve on the shortcomings of recursive inversion with respect to relative and absolute scale of the impedance results, resolution of impedance boundaries, and distortion from residual wavelet effects. (11 refs.)

104237 Migration with the full acoustic wave equation. D.D.Kosloff, E.Baysal (Seismic Acoustics Lab., Univ. of Houston, Houston, TX, USA).
Geophysics (USA), vol.48, no.6, p.677-87 (June 1983).
Conventional finite-difference migration has relied on one-way wave equations which allow energy to propagate only downward. Although generally reliable, such equations may not give accurate migration when the structures have strong lateral velocity variations or step dips. An alternative approach based on the full acoustic wave equation is examined. The migration algorithm developed from this equation was tested against synthetic data and against physical model data. The results indicated that such a scheme gives accurate migration for complicated structures. (9 refs.)

104238 Seismic shear-wave observations in a physical model experiment. R.H.Tatham, D.V.Goolsbee, W.F.Massell (Petty-Ray Geophys., Houston, TX, USA), H.R.Nelson.
Geophysics (USA), vol.48, no.6, p.688-701 (June 1983).
The observation and common-depth-point (CDP) processing of mode-converted shear waves is demonstrated for real data collected in a physical model experiment. Data were collected in both an end-on-CDP model, with offsets from 1000 ft to 20000 ft, and a variety of walk-away experiments with scaled ranges from 1000 ft to 31000 ft. Processing and analysis of the data confirm the existence of mode-converted shear-wave reflections in a modeled marine environment. (7 refs.)

104239 Continuously time-variable recursive digital band-pass filters for seismic signal processing. R.A.Stein, N.R.Bartley (Dept. of Electrical Engng., Univ. of Calgary, Calgary, Alberta, Canada).
Geophysics (USA), vol.48, no.6, p.702-13 (June 1983).
A design technique is described for continuously time-variable recursive digital band-pass filters for seismic signal processing. Two types of band-pass filters are considered: a cascade of a low-pass and a high-pass filter, and a direct band-pass filter, with all filters being derived from a continuous unit-bandwidth Butterworth low-pass prototype. Data are given for determining the length of the interpolation interval to meet prescribed worst case magnitude and frequency error criteria. (13 refs.)

104240 Migration by extrapolation of time-dependent boundary values. G.A.McMechan (Pacific Geosci. Center, Dept. of Energy, Mines & Resources, Sidney, BC, Canada).
Geophys. Prospect. (Netherlands), vol.31, no.3, p.413-20 (June 1983).
Migration of an observed zero-offset wavefield can be performed as the solution of a boundary value problem in which the data are extrapolated backward in time. This concept is implemented through a finite-difference solution of the two-dimensional acoustic wave equation. All depths are imaged simultaneously at time 0 (the imaging condition), and all dips (right up to vertical) are correctly migrated. Numerical examples illustrate this technique in both constant and variable velocity media. (13 refs.)

104241 Radiation and receiver pattern of shear and compressional waves as a function of Poisson's ratio. S.Kahler, R.Meissner (Inst. fur Geophys., Univ. Kiel, Kiel, Germany).
Geophys. Prospect. (Netherlands), vol.31, no.3, p.421-35 (June 1983).
Shear (=S) wave studies and compressional (=P) wave surveys have revealed that S-wave velocities are much more variable than P-wave velocities. This strongly affects Poisson's ratio σ, especially in young sediments. It is shown that σ has a great influence on the directivity pattern. For their calculation, well-known surface boundary conditions and White's statement of the reciprocity relation (White 1965) are used. They also form the basis for the combination of source and receiver patterns essential for practical field work. The various combinations of horizontally and vertically arranged sources and receivers are investigated. (8 refs.)

104242 Wavefront divergence, multiples, and converted waves in synthetic seismograms. F.Hron, J.D.Covey (Amoco Production Co., Tulsa, OK, USA).
Geophys. Prospect. (Netherlands), vol.31, no.3, p.436-56 (June 1983).
Synthetic seismograms can be very useful in aiding understanding of wave propagation through models of real media, verification of geologic models derived from interpretation of field seismic data, and understanding the nature and complexity of wave phenomena. Various needs for computation are discussed. Various seismograms, computed via asymptotic ray theory and an automatic ray generation scheme, are presented for a highly simplified North Sea velocity structure. (27 refs.)

104243 Absorption-dispersion relations for Love channel waves. M.Dobroka, T.Ormos (Dept. of Geophys., Tech. Univ. for Heavy Industry, Egyetemvaros, Hungary).
Geofiz. Koeslemenyek (Hungary), vol.29, no.2, p.117-27 (June 1983).
Starting from the rheological equations of the Poynting-Thomson model, dispersion relations are derived for horizontally-polarised Love waves travelling in a stratum bounded by two different semi-infinite media. Numerical solutions to the complex dispersion relation and absorption-dispersion curves are also given in three special cases. (5 refs.)

104244 Preliminary results of numerical modelling of 'seam-waves'. A.Bodoky (Computer & Automation Inst., Hungarian Acad. of Sci., Budapest, Hungary), T.Bodoky.
Geofiz. Koeslemenyek (Hungary), vol.29, no.2, p.129-40 (June 1983).
Suggests a numerical modelling scheme for elastic waves channelled through coal seams. The numerical modelling is based on the finite difference solution of the elastic wave equation. Boundary conditions are satisfied by the explicit approximation technique. Input motions given for the consecutive time instants supply the initial condition. Snapshots of the motion and seismograms are computed and some examples are provided to illustrate the potential of finite difference modelling. (14 refs.)

104245 Influence of charge depth on the frequency content of seismic waves. H.Rische (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).
Geofiz. Koeslemenyek (Hungary), vol.29, no.2, p.163-71 (June 1983).
In experiments aimed at broadening the frequency pass-band of shot generated seismic waves the charge depth was hardly considered hitherto. By means of field data it is demonstrated that by decreasing the charge depth essentially higher frequencies and hence considerable signal compression can be achieved. This effect may favourably be applied in shallow seismic surveys using P-waves. (7 refs.)

104246 Contemporary seismicity of the Pamirs and diagrams of the seismogenic zones of the territory. R.S.Mikhaylova (Inst. of Earthquake Resistant Construction & Seismology, Acad. of Sci., Tadzhik SSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli,* vol.18, no.7, p.486-90 (1982).
An analysis of the crustal seismicity of the Pamirs is presented which indicates the existence of a seismogenic zone of near-north-south trend. (14 refs.)

104247 The seismic cross section and strength of the lithosphere of Iceland. S.S.Demin (Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli,* vol.18, no.7, p.491-5 (1982).
A mechanical analysis is made of a seismic model of the deep structure of Iceland. The model is characterized by a thin suboceanic crust underlaid by an anomalous, partially molten mantle. Tangential stresses created by inhomogeneities of the external relief and by density inhomogeneities in the crust are estimated. The estimates obtained for the Vatnajokull glacial shield are analyzed. (28 refs.)

104248 The effect of the length of a shear fracture on the nature of the radiation [earthquake focus]. S.A.Strizhkov, A.A.Pavlov (Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli,* vol.18, no.7, p.496-501 (1982).
The results of experimental studies of the rupture rate and the nature of the radiation of prepared fractures of shear type as a function of their length are presented. With an increase in the length of the fractures the rupture rate increases. The radiation pattern when this rate attains a supersonic velocity becomes symmetrical with respect to the fracture plane, and the greater part of the energy is radiated in the rupture direction. (9 refs.)

104249 An experiment in systematic study of global seismicity: centroid-moment tensor solutions for 201 moderate and large earthquakes of 1981. A.M.Dziewonski, J.H.Woodhouse (Dept. of Geological Sci., Harvard Univ., Cambridge, MA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3247-71 (10 April 1983). [received: Aug. 1983] (Anton L. Hales Symposium on 'Some Recent Advances in Geophysics', Dallas, TX, USA, 5-6 Oct. 1981).
Data from the Global Digital Seismograph Network were used to obtain 'centroid-moment tensor' solutions using the method of Dziewonski et al. (1981). Results were obtained for 201 earthquakes ranging in seismic moment from 7×10^{23} to 3×10^{27} dyne-cm. The wide dynamic range of the SRO/ASRO stations the same algorithm to be used to investigate series of events among which the smallest and the largest may differ in moment by a factor as large as 1000. Among the events studied is a particularly interesting series, in January 1981, off the island of Honshu. The source mechanisms of all these earthquakes are discussed. (36 refs.)

104250 Total-moment spectra of fourteen large earthquakes. P.G.Silver, T.H.Jordan (Geological Res. Div., Scripps Inst. of Oceanography, La Jolla, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3273-93 (10 April 1983). [received: Aug. 1983] (Anton L. Hales Symposium on 'Some Recent Advances in Geophysics', Dallas, TX, USA, 5-6 Oct. 1981).
Total-moment spectra $M_T(\omega)=\|M(\omega)\|\sqrt{2}$, where M is the moment rate tensor, are computed for 14 large earthquakes recorded by the International Deployment of Accelerometers (IDA) network using the scalar-moment retrieval method proposed by Silver and Jordan [1982]. For each event we obtain estimates of M_T averaged over the 10 disjunct, 1-mHz intervals in the low-frequency and 1-11 mHz; typical IDA record sets from events with $M_T \gtrsim 0.2$ A (1 A$=10^{27}$ dyne.cm) yield standard errors on the 1-mHz averages that are generally less than 20%. Our multiple-band estimates of M_T are usually consistent with comparable single-band values found by other investigators. From the total-moment spectra we derive the zero-frequency (static) moment $M_T{}^0 \equiv M_T(0)$ and the characteristic source duration $\tau_c \equiv 2\ (\mathrm{Var}\ [f(t)])^{1/2}$, where $f(t)$ is the time function of the moment rate tensor, assumed to be the same for all components. (60 refs.)

104251 Travel times and station corrections for P waves at teleseismic distances. A.M.Dziewonski (Dept. of Geological Sci., Harvard Univ., Cambridge, MA, USA), D.L.Anderson.
J. Geophys. Res. (USA), vol.88, no.B4, p.3295-314 (10 April 1983). [received: Aug. 1983] (Anton L. Hales Symposium on 'Some Recent Advances in Geophysics', Dallas, TX, USA, 5-6 Oct. 1981).
Approximately 3300 shallow focus earthquakes and 1000 seismic stations have been used in a study of P wave travel times and station residuals, including azimuthal effects. The events were selected from a catalog containing 160000 earthquakes, and those having uniform distance and azimuthal coverage were systematically relocated and used to refine P wave travel times and station corrections. Station corrections are provided for 994 seismic stations. The station corrections involve three terms: the static effect and two cosine terms with appropriate phase shifts. They exhibit general consistency over broad geographic areas and, where coverage is dense, often show abrupt changes from one geological province to another. The cos 2θ terms appear to be due to upper mantle anisotropy, and they correlate with the stress direction in the crust. (26 refs.)

104252 Multimode Rayleigh wave attenuation and Q_β in the crust of the Barents shelf. A.Kijko, B.J.Mitchell (Dept. of Earth & Atmospheric Sci., Saint Louis Univ., St. Louis, MO, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3315-28 (10 April 1983). [received: Aug. 1983] (Anton L. Hales Symposium on 'Some Recent Advances in Geophysics', Dallas, TX, USA, 5-6 Oct. 1981).
The multimode method of Cheng and Mitchell [1081] is used to study the attenuation properties of the crust throughout the Barents shelf. The sensitivity of the spectra to various source factors and to propagation factors which might characterize a shelf region are thoroughly studied. For plane-layered models, the method is very sensitive to Q_β in the upper crust and to Q_β of sedimentary layers if those layers are thick and highly attenuating. The fundamental mode, but not the higher mode, spectra for one path across the

Barents shelf are, apparently, distorted at short periods by lateral heterogeneities along the travel path. Simple two-layer, trial-and-error inversions yield a model of the Barents shelf with an upper crustal Q_β value of about 80. Three-layer inversions with a sedimentary layer, however, yield an upper crustal Q_β of about 250, if the sediments are 1 km thick and are characterized by Q_β values of 40. Seismic velocity models are presented. (30 refs.)

104253 COCORP and the continental crust. J.Oliver, F.Cook, L.Brown (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3329-47 (10 April 1983). [received: Aug. 1983] (Anton L. Hales Symposium on 'Some Recent Advances in Geophysics', Dallas, TX, USA, 5-6 Oct. 1981).
Seismic reflection profiling data from the COCORP project, coupled with other kinds of geophysical and geological observations, suggest some fresh perspectives on the crust. For example, there is evidence for great differences within the basement at a single site and from one COCORP site to another. A simple layered model is surely not an adequate representation of the crust in most areas. There is, however, the puzzling and rather common occurrence of limited zones of parallel, though not always flat, layered features at various depths in certain parts of the crust. Are the corresponding rocks metasedimentary? Or igneous? Or both? There are transparent zones from which little or no coherent reflected seismic energy is detected. Are the corresponding rocks intrusions? Or highly deformed metasediments? The authors answer these and other questions in this speculative paper. (42 refs.)

104254 Changes in compressional and shear wave velocities and dynamic moduli during operation of a hot dry rock geothermal system. C.F.Pearson (Earth & Space Sci. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), M.C.Fehler, J.N.Albright.
J. Geophys. Res. (USA), vol.88, no.B4, p.3468-75 (10 April 1983). [received: Aug. 1983]
Compressional and shear wave velocities measured during cross well seismic surveys are found to decrease during operation of a hot dry rock geothermal system. This relative *P* and *S* wave velocity decrease is very close to values predicted by O'Connell and Budiansky (1974), who modeled velocities in rocks containing fluid-saturated and dry cracks. Because the author's data fit their model quite well, attribute the velocity decrease to an increased density of fluid-filled fractures in the reservoir. Fracture density parameters of O'Connell and Budiansky range as high as 0.365 near the main heat transfer areas of the geothermal reservoir. The dynamic shear and Young's modulus are significantly lower near the principal heat transfer surfaces, but the bulk modulus is largely unaffected. These observations suggest that the velocity differences are caused by fully saturated fractures. (26 refs.)

104255 Kinematic analysis of strong motion *P* and *SV* waves from the Sterling event. C.A.Langston (Dept. of Geosci., Pennsylvania State Univ., University Park, PA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3486-97 (10 April 1983). [received: Aug. 1983]
P and *SV* velocity waveforms from the Sterling explosion of December 3, 1966, are analyzed from a point of view often taken in earthquake source studies. The detonation occurred in the cavity excavated by the Salmon explosion within the Tatum salt dome, Mississippi. Velocity recordings taken from nearby borehole strong motion instruments show the occurrence of significant *SV* energy. Kinematic source models are constructed by considering constraints afforded by the preshot cavity, condition of the surrounding material, and aspects of the *P* and *SV* waveforms such as wave polarity and duration. Waveforms for these models are computed and compared directly with the data. (21 refs.)

104256 Present seismic evidence for a boundary layer at the base of the mantle. D.J.Doornbos (Norges Teknisk Naturvitanskapelige Forsknungsrad, Norwegian Seismic Array, Kjeller, Norway).
J. Geophys. Res. (USA), vol.88, no.B4, p.3498-505 (10 April 1983). [received: Aug. 1983]
To improve the global coverage needed in investigating the observational consequences of boundary layer models, the existing data set has been extended with long-period diffracted *P* and *SH* from the SRO network, and short-period diffracted *P* from the NORSAR array. It was found that on average, the amplitude decay of diffracted *SH* is relatively small, in accordance with the majority of previously published WWSSN data, and consistent with the observed weakness in dispersion of this phase. These results, in combination with the apparent absence of anomalously high $dT/d\Delta$, can be explained by a relatively thin ($\leq$100 km) low-velocity zone at the base of the mantle. Long-period diffracted *P* wave data probably lack the required resolution for detecting a relatively thin transition zone. The existence of such a zone is discussed. (26 refs.)

104257 Focal depths of intracontinental and intraplate earthquakes and their implications for the thermal and mechanical properties of the lithosphere. Wang-Ping Chen (Dept. of Geology, Univ. of Illinois, Urbana, IL, USA), P.Molnar.
J. Geophys. Res. (USA), vol.88, no.B5, p.4183-214 (10 May 1983).
Investigates the distribution of focal depths for earthquakes that do not appear to be associated with zones of recent subduction, using both new results from analyses of individual events recorded at teleseismic distances and published data for both microearthquakes and larger events. The deepest events in oceanic regions occur in old lithosphere, and excluding earthquakes in active mountain belts, the deepest crustal events occur in old cratons. Therefore, the temperature at the source region is likely to be an important factor determining whether deformation occurs seismically or not. From estimates of the temperature at depths of the deepest events, it is concluded that those limiting temperatures are about 250°-450°C and 600°-800°C for crustal and mantle materials, respectively. Both the upper crustal and the mantle seismic regions correspond to zones of relatively high strength and they are separated by a zone of lower strength in the lower crust where aseismic, ductile deformation predominates. (200 refs.)

104258 Triple seismic zone and the regional variation of seismicity along the northern Honshu arc. H.Kawakatsu, T.Seno (Dept. of Geophys., Stanford Univ., Stanford, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B5, p.4215-30 (10 May 1983).
The regional variation of seismicity along the northern Honshu arc, Japan, is studied using accurate focal depths and focal mechanism types. The types of the focal mechanisms of 184 events were determined using P wave first motion data. Based on historical seismicity of great and large earthquakes, the authors divide the zone of thrust type earthquakes at the plate interface into two regions: the shallow thrust zone (0-40 km), where great earthquakes ($M_s \sim 8.0$) occur, and the deep thrust zone (40-60 km), where large earthquakes ($M_s \sim 7.4$) occur. The activity of great or large earthquakes shows a variation along the arc. (51 refs.)

104259 Preseismic rupture progression and great earthquake instabilities at plate boundaries. V.C.Li (Dept. of Civil Engng., MIT, Cambridge, MA, USA), J.R.Rice.
J. Geophys. Res. (USA), vol.88, no.B5, p.4231-46 (10 May 1983).
A procedure is presented for modeling the initially quasi-static upward progression of a zone of slip from some depth in the lithosphere toward the Earth's surface, along a transform plate margin, culminating in a great crustal earthquake. Stress transmission in the lithosphere is analyzed with a generalized Elsasser model, in which elastic lithospheric plates undergo plane stress deformation and are coupled by an elementary foundation model to a Maxwellian viscoelastic asthenosphere. Upward progression of rupture over a finite length of plate boundary, corresponding to a seismic gap along strike, is analyzed by a method based on the 'line-spring' concept, whereby a two-dimensional antiplane analysis of the upward progression provides the relation between lithospheric thickness-averaged stress and slip used as a boundary condition in the generalized Elsasser plate model. The formulation results in a nonlinear integral equation for the rupture progression as a function of time and distance along strike. A simpler approximate single degree of freedom analysis procedure is described and shown to lead to instability results that can be formulated in terms of the slip-softening slope at the boundary falling below the elastic unloading stiffness of the surroundings. (35 refs.)

104260 Local seismicity preceding the March 14, 1979, Petatlan, Mexico earthquake ($Ms=7.6$). V.Hsu, J.F.Gettrust, C.E.Helsley, E.Berg (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
J. Geophys. Res. (USA), vol.88, no.B5, p.4247-62 (10 May 1983).
Local seismicity surrounding the epicenter of the March 14, 1979, Petatlan, Mexico earthquake was monitored from 6 weeks before to 4 weeks after the main shock. Prior to the main shock, the recorded local seismic activity was shallow and restricted within the continental plate above the Benioff zone. The relocated main shock hypocenter also lay above the Benioff zone, suggesting an initial failure within the continental lithosphere. Four zones can be recognized that showed relatively higher seismic activity than the background. A possible connection is inferred between the observed earthquake migration pattern and the subduction of a fracture zone because the 200-km segment that includes the aftershock zones of the Petatlan earthquake and the three preceding moderate earthquakes matches the intersection of the southeastern limb of the Orozco Fracture Zone and the Middle America Trench. (29 refs.)

104261 Seismic rupture patterns in Oaxaca, Mexico. F.Tajima, K.C.McNally (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B5, p.4263-75 (10 May 1983).
The spatio-temporal patterns of seismic activity for events with body wave magnitude $m_b \geq 4.0$ are investigated for the three most recent large earthquakes in the Oaxaca region of southern Mexico (August 23, 1965, $M_s=7.6$, $M_w=7.5$; August 2, 1968, $M_5=7.1$, $M_w=7.3$; November 29, 1978, $M_w=7.8$, $M_w=7.6$). A master catalogue of earthquakes is compiled for the analyses. The events are then relocated with the Joint Hypocenter Determination (JHD) method. At this magnitude threshold it was found that the aftershock zone of the 1965 earthquake was seismically quiescent for at least 20 months prior to the main event; the 1968 earthquake was preceded by 1 year of foreshock type activity clustered in the aftershock zone; the 1978 earthquake was preceded by 43 months of quiescence and one event ($m_b=4.7$) within the aftershock zone 4 months prior to the mainshock. A segment of the subduction zone in Oaxaca remains unbroken by these earthquakes. (16 refs.)

104262 Breaking of a single asperity: rupture process and seismic radiation. S.Das (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA), B.V.Kostrov.
J. Geophys. Res. (USA), vol.88, no.B5, p.4277-88 (10 May 1983).
The problem of spontaneous shear rupture of a single circular asperity on an infinite fault plane is studied. Initially, the fault plane is broken everywhere except at a circular asperity. An applied displacement at infinity results in a stress concentration along the bounding edge of the asperity. The frictional stress on the broken part of the fault plane is taken to be a constant. Once a point on the asperity breaks, the stress there drops to the same value as on the 'main' fault surface. The rupture is started by relaxing the shear stress at a point on the asperity edge and is then allowed to propagate spontaneously, using a critical stress level fracture criterion. The rupture process is calculated numerically. It is found that for asperities of constant strength, the rupture first propagates around the edge of the asperity and then inward, a phenomenon best described by the well-known term of classic military maneuver: 'the double encircling pincer movement'. (21 refs.)

104263 Spectral characteristics of high-frequency P_n, S_n phases in the Western Pacific. D.A.Walker, C.S.McCreery (Hawaii Inst. of Geophys., Honolulu, HI, USA), G.H.Sutton.
J. Geophys. Res. (USA), vol.88, no.B5, p.4289-98 (10 May 1983).
Pn and Sn phases from 25 selected earthquakes recorded since July of 1979 on ocean bottom hydrophones near Wake Island are used to complement and extend prior investigations of high-frequency Pn, Sn spectra in the Western Pacific. At a distance of about 18° ($\simeq$2000 km), frequencies for Pn and Sn are as high as 30 and 35 Hz, respectively; at a distance of about 30° ($\simeq$3300 km), as high as 15 and 20 Hz, respectively. Pn phases lose their high-frequency energy more rapidly than Sn phases do, yet Pn wavetrains are much longer than Sn wavetrains. Pn wavetrains of longer duration, more energy, and higher frequencies are found for travel paths primarily in the Northwestern Pacific Basin than for travel paths across the transition zone from the shallow Ontong-Java Plateau to the deep Northwestern Pacific Basin. Sn phases are extremely weak or absent for travel paths crossing this transition zone from the shallower Ontong-Java Plateau to the deeper Northwestern Pacific Basin. (17 refs.)

104264 The inverse problem of a spherically symmetric fluid Earth. S.Coen (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B5, p.4299-303 (10 May 1983).
It is shown that the density and bulk modulus profiles of a spherically symmetric fluid Earth model are uniquely determined from the surface particle acceleration and pressure at two arbitrary frequencies. The excitation is a harmonically oscillating point source which is located on the surface of the Earth. (12 refs.)

104265 Shear and compression wave measurements in shocked polycrystalline Al_2O_3. Y.M.Gupta (SRI Internat., Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B5, p.4304-12 (10 May 1983).
Experimental techniques have been developed to study the propagation of large-amplitude, one-dimensional shear and compression waves in shocked solids of geophysical interest. Shear wave velocities and amplitudes can be directly measured along with the usual measurements on longitudinal waves. Experimental measurements to 90 kbar compressive shock stresses are reported in Al_2O_3. Within experimental scatter ($\pm$2%), the shear wave velocity data are in good agreement with the extrapolation of the ultrasonic

measurements. The experimental developments reported are expected to be important to high pressure geophysics applications because they provide a direct measure of the shear modulus in the shocked state. The shear modulus is not only a more sensitive indicator of the solid state than the longitudinal modulus but in conjunction with the longitudinal wave data can provide the mean stress-volume relations for comparison with static data. (21 refs.)

104266 A study of the importance of nonlinearity in the inversion of earthquake arrival time data for velocity structure. G.L.Pavlis, J.R.Booker (Univ. of Washington, Seattle, WA, USA).
J. Geophys. Res. (USA), vol.88, no.B6, p.5047-55 (10 June 1983).
All techniques that currently exist to invert arrival time data from earthquake sources for velocity structure rest on a local linearization of the nonlinear equations relating these data to the velocity model. The authors have studied the limitations imposed by this approximation using synthetic data in which a one dimensional velocity model is the only variable. This problem is found to be sufficiently nonlinear that some iterative scheme is generally required to obtain results that are quantitatively correct. Convergence to a solution linearly close to the truth is fairly readily achieved whenever the resolution of the data is sufficient to resolve the structure of the true velocity model. Convergence to solutions that are not linearly close where found to occur, however, when the true velocity model contained significant unresolvable structure. (13 refs.)

104267 Teleseismic detection in the Aleutian Island Arc. R.E.Habermann (Univ. of Colorado, Boulder, CO, USA).
J. Geophys. Res. (USA), vol.88, no.B6, p.5056-64 (10 June 1983).
Recently it has become apparent that teleseismic detection of earthquakes has decreased substantially in many regions of the world. The major decrease was related to the closure of the VELA arrays in the United States during the late 1960's. In this paper the effect of the closure of these arrays on the reporting of events in the Aleutian Island Arc is examined. In the Aleutians, the detection history is complicated by the short-term installation of a local network on and near Amchitka Island during the early 1970's. The temporal coincidence of the installation of this network and the closure of the VELA arrays delayed the detection decrease in the central Aleutians until the Amchitka network was closed in early 1973. (10 refs.)

104268 A seismic risk evaluation in Korea. S.G.Kim (Dept. of Phys., Hanyang Univ., Seoul, Korea), S.J.Kim.
J. Phys. Earth (Japan), vol.30, no.5, p.441-50 (1982).
A seismic risk map of Korea is constructed using the modified first asymptotic distribution of the extreme value theory (Kim, 1981). The seismic data of historical earthquakes (1405-1905) and instrumentally recorded earthquakes (1906-1981) are obtained from the ancient Korean documents and seismograph stations, respectively. Maximum potential earthquakes that are expected to occur with a 10% exceeding probability within 30 years are estimated in 6 seismic provinces of the Korean Peninsula. Maximum ground accelerations or particle velocities for all points on a grid are computed. (18 refs.)

104269 Moment and duration of shallow earthquakes from Love-wave modelling for regional distances. W.Brustle, G.Muller (Inst. of Meteorology & Geophys., Frankfurt, Germany).
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.312-24 (July 1983).
Love waves from five earthquakes in southwest Germany, Italy, Yugoslavia, Greece and Algeria, as recorded at the broadband Grafenberg array in eastern Bavaria, are modelled in detail using an extended reflectivity method. The focal mechanisms are taken from the literature or determined from long-period WWNSS data. The theoretical double-couple moment function used for modelling increases smoothly during the risetime T from zero to the seismic moment M_0. T and M_0 are determined by matching the observed and theoretical Love-wave seismograms in the long-period WWNSS frequency band. T is approximately equal to the rupture duration; values from 1.4 to 20 s are found. The present results show that accurate Love-wave modelling for a single station at regional distance from an epicentre is a reliable method for estimation of seismic moment and rupture duration. (21 refs.)

104270 Extreme value distribution of earthquake magnitude. Zi Jun Gan (Inst. of Oceanology, Acad. Sinica, Shandong, China), C.C.Tung.
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.325-30 (July 1983).
Probability distribution of maximum earthquake magnitude is first derived for an unspecified probability distribution of earthquake magnitude. A model for energy release of large earthquakes, similar to that of Adler-Lomnitz and Lomnitz, is introduced from which the probability distribution of earthquake magnitude is obtained. An extensive set of world data for shallow earthquakes, covering the period from 1904 to 1980, is used to determine the parameters of the probability distribution of maximum earthquake magnitude. Because of the special form of probability distribution of earthquake magnitude, a simple iterative scheme is devised to facilitate the estimation of these parameters by the method of least-squares. The agreement between the empirical and derived probability distributions of maximum earthquake magnitude is excellent. (9 refs.)

104271 Synthetic P-wave seismograms for the Kinnaur (Himachal Pradesh, India) earthquake of January 19, 1975. A.R.Banghar (Neutron Phys. Div., Bhabha Atomic Res. Centre, Trombay, Bombay, India).
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.331-41 (July 1983).
Long-period P-wave seismograms are computed for the Kinnaur earthquake of January 19, 1975, using a bilateral-bidirectional propagating rectangular fault model. Comparison of computed and observed P-wave seismograms shows good agreement. Hence, it is inferred that a bilateral-bidirectional fault is a suitable model for this earthquake. (31 refs.)

104272 A new approach for studying microseism data and coda wave analysis. M.H.Sarachaga (Catedra de Geofisica, Univ. Complutense, Madrid, Spain), J.M.Rodriguez.
Rev. Geofis. (Spain), vol.38, no.2, p.167-78 (1982). In Spanish.
Microseismicity studies are an interesting and useful tool in order to determine the activity of a fault or to improve the knowledge of the general seismicity of a specific area. Unfortunately, the possibilities of the microseismicity data are strongly diminished when data are, as is usual in Spain, paper recorded. A new method, based on coda wave analysis and specially designed for dealing with this problem is presented. This method allows one to evaluate the quality factor Q and the $M_L - M_0$ relations for each analyzed area. Its theoretical background and its application to the regions of Arette (French Central Pyrenees), Lorca (South-east of Spain) and Granada, are also described. (26 refs.)

104273 Historical development of seismic catalogues for Spain. D.Munoz, A.Udias (Catedra de Geofisica, Univ. Complutense, Madrid, Spain).
Rev. Geofis. (Spain), vol.38, no.2, p.189-93 (1982). In Spanish.
Since the publication of the first lists of earthquakes in XVII century, interest on these studies grew and gave rise to seismic catalogues. These catalogues started to be published in a standard fashion after Perrey's work in 1847. In the present work national and regional seismic catalogues of Spain, as well as other more general lists with information on Spanish earthquakes are presented. (26 refs.)

104274 Inversion and deconvolution: foreplay and interplay. J.M.Mendel (Dept. of Electrical Engng., Univ. of Southern California, Los Angeles, CA, USA).
1983 IEEE International Symposium on Circuits and Systems, Newport Beach, CA, USA, 2-4 May 1983 (New York, USA: IEEE 1983), p.940-8 vol.2
Geo-optimal deconvolution is a procedure that interweaves maximum-likelihood deconvolution and maximum-likelihood normal incidence inversion so as to capture the strong points of both procedures. It is also known as model-based deconvolution and represents the first effort, to the best of our knowledge, to combine deconvolution and inversion. This is possible because our maximum-likelihood deconvolution and maximum-likelihood normal incidence inversion solutions are each optimal in a maximum-likelihood sense, and because of the invariance principle of maximum-likelihood estimation, that, functions of maximum-likelihood estimates are, themselves, maximum-likelihood estimates. The paper describes ML NI inversion, maximum-likelihood deconvolution (MLD) and normal incidence geo-optimal deconvolution (NIGOD). (34 refs.)

91.35 EARTH'S INTERIOR STRUCTURE AND PROPERTIES

104275 Geochemistry, mineralogy and petrogenesis of lavas erupted along the Southwest Indian Ridge between the Bouvet triple junction and 11 degrees east. A.P.Le Roex (Depts. of Geology & Geochem., Univ. of Cape Town, Rondebosch, S Africa), H.J.B.Dick, A.J.Erlank, A.M.Reid, F.A.Frey, S.R.Hart.
J. Petrol. (GB), vol.24, no.3, p.267-318 (Aug. 1983).
Basaltic lavas from fracture zones and ridge segments have been systematically sampled along the Southwest Indian Ridge from the Bouvet triple junction to 11°E. Detailed studies of the major and trace element and isotopic variations in these lavas serve to distinguish three compositional groupings which occur throughout this region. (57 refs.)

104276 Geothermic lineaments in Morocco. L.Bahi (Ecole Mohammadia, Rabat, Morocco), N.El Yamine, J.-J.Risler.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1087-92 (18 April 1983). In French.
One, perhaps two, lineaments of high heat flow have been identified in Morocco, following geological and geophysical criteria: fracture patterns, seismic zones, gravity and thermal springs and direct heat-flow measurements. These lineaments are of interest for the exploitation of geothermal energy in Morocco. (16 refs.)

104277 Stratigraphy and paleobiogeography of Upper Senonian rudistid reefs from southeastern Sicily. Relationships with submarine volcanism. G.Camoin, J.Philip (Univ. de Provence, Marseille, France), M.-C.Bernet-Rellande.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1093-6 (18 April 1983). In French.
Upper Senonian rudistid reefs from the Iblean Domain (southeastern Sicily) are the subject of a stratigraphic study. Their regional evolution is described with respect to local volcanism acting over the Iblean margin during the Upper Senonian. Paleogeographic conclusions through rudistid evolution help in understanding the relationships between African and Apulian margins near the end of the Cretaceous. (27 refs.)

104278 Radiometric data (^{40}K-^{40}Ar) on K-minerals from Triassic of the 'Zone des Nappes' in Northern Tunisia. Cretaceous and Tertiary thermal events. H.Bellon, V.Perthuisot (Dept. des Sci. de la Terre, Univ. de Brest, Brest, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1539-44 (30 May 1983). In French.
Radiometric ages confirm the existence of a drastic thermal event in the Eastern Maghreb during the Middle Cretaceous and the synchronism between heating phases and magmatic phases during the Tertiary. (16 refs.)

104279 The 'Cicatrice de Preit': a major structural discontinuity in the internal Brianconnais zone between Acceglio and the Argentera Massif (Southern Cottic Alps). R.Lefevre (Lab. de Geodynamique Interne, Univ. Paris-XII, Creteil, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1551-4 (30 May 1983). In French.
South of the Maira and NE of the Argentera Massif, the internal Brianconnais, Ultrabrianconnais and Piemontais Nappes of the Acceglio, Roure, and Ceillac Bands are truncated obliquely by a fault belonging to the N110° sinistral strike-slip fault zone of the 'Couloir de la Stura'. Prior to the movement along this fault the Brianconnais and Ultrabrianconnais rocks of the Cottic Alps were probably much less distant from those of the Ligurian Alps than they are today. (20 refs.)

104280 Fault tectonics and Cenozoic stress fields in the Hungarian central mountains: mechanisms and chronology of the extension in the Pannonian basin (Hungary). F.Bergerat, J.Geyssant, C.Lepvrier (Dept. de Geotectonique, Univ. Pierre-et-Marie-Curie, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1555-8 (30 May 1983). In French.
A fault analysis in the Hungarian central mountains enables one to distinguish four main tectonic events during the Tertiary. This succession reflects the complexity of deformations in the Pannonian basin: East-West compression with westward movement of moesian block, North-South and East-West multi-directional extension due to southward subduction of the substratum of carpathian flyschs, and finally North-South compression with conjugate strike-slip faults. (6 refs.)

104281 Huahine Island: three successive volcanoes (Society Archipelago, Polynesia). R.Brousse, C.Macherey, E.Berger, G.Boutault (Lab. de Petrologie et Volcanologie, Univ. Paris-XI, Orsay, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1559-62 (30 May 1983). In French.
Huahine Island is a link of the Society line produced by the hot spot now to SE of Mehetia. The island is polygenous and built in five phases. The first four following an echelon directed North-South, the last one is extensive following the direction of the Society line. (5 refs.)

104282 On dating the magmatism of Maio, Cape Verde Islands. J.G.Mitchell (School of Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England), M.J.Le Bas, J.Zielonka, H.Furnes.
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.61-76 (July 1983).
Conventional K-Ar and ^{40}Ar/^{39}Ar studies of Mesozoic ocean floor basalts and Tertiary plutonic and volcanic rocks from Maio, Cape Verde Islands, have been determined to elucidate the magmatic evolution of this ocean island. Pillow lavas of the Basement Complex yield a minimum age of 113±8 Ma. Activity in the Central Intrusive Complex began before 20 Ma and plutons continued to develop until about 8 Ma. Sheet intrusion occurred throughout the period 20 to 9 Ma though the peak of this activity probably occurred 11 Ma ago. Volcanic activity began in the Tertiary, probably before 12 Ma, and culminated in the development of a stratovolcano at 7 Ma. (17 refs.)

104283 Calculations on the thermal conditions around a salt diapir. P.K.Jensen (Inst. for Geofysik, Kobenhavns Univ., Kobenhavn, Denmark).
Geophys. Prospect. (Netherlands), vol.31, no.3, p.481-9 (June 1983).
Temperature modeling around the Vejrum salt structure in Denmark shows that the heat flow near the top is twice the regional heat flow. The temperature in the vicinity of the top of the diapir is thus anomalously high. Overlying permeable formations could therefore be attractive for geothermal energy exploitation. A negative temperature anomaly of −20°C is calculated around the root of the salt body. Comparisons between calculated and measured temperatures are used to test the model. It is shown that measurements of heat flow (or temperature gradients) in wells penetrating the region of groundwater circulation could be used in identification of salt diapirs. (15 refs.)

104284 Geothermal conditions of Hungary. P.Dovenyi, F.Horvath (Dept. of Geophys., Eotvos Lorand Univ., Budapest, Hungary).
Geofiz. Koeslemenyek (Hungary), vol.29, no.1, p.3-58 (April 1983).
A brief review is given of the history of geothermal investigations in Hungary followed by a summary of the methods of temperature measurement, their reliability and applicability. All available and valuable temperature data are qualified on the basis of conditions and probable accuracy of measurements and are listed in a temperature catalogue. A map of geoisotherms at 1 km depth and another at 2 km depth are constructed for Hungary and adjoining territories. Average temperature vs. depth profiles are presented for different sub-units of the Pannonian basin. All Hungarian measurements are used to obtain the average thermal conductivities of Neogene sedimentary rocks and of basement rocks. Hungarian heat flow determinations are reviewed. A method is proposed for estimating the heat flow value for boreholes where no actual thermal conductivity measurements were performed but the temperature conditions and the lithology are well known. A review is given on the geodynamic interpretation of the Pannonian basin thermal anomaly and attention is called to the importance of knowledge of the paleogeothermal conditions. (148 refs.)

104285 Thermal regime of the Luanshya Mine, Republic of Zambia. D.S.Chapman (Dept. of Geology & Geophys., Univ. of Utah, Salt Lake City, UT, USA).
Geoexploration (Netherlands), vol.21, no.4, p.265-81 (1983).
Temperature surveys have been conducted in 24 drillholes within and surrounding the Luanshya Mine on the Zambian Copperbelt. Detailed temperature logs in drillholes within the mine reveal several thermal effects. A composite plot of temperatures versus depth on a north-south section through the Roan-Muliashi Basin reveals a systematic depression of isotherms and hence decreasing geothermal gradients from 23 to 18C° km^{-1} towards the deepest part of the syncline. Thermal conductivity measurements on 156 representative samples from the major lithologic units comprising and surrounding the Roan-Muliashi Basin indicate that the Mine Series formations are about 16% more conductive than the surrounding Basement Complex rocks. Theoretical thermal models for the mine, examined using finite difference numerical techniques are discussed. (15 refs.)

104286 A 550 km long Moho traverse in the Tyrrhenian Sea from OBS recorded P_N waves. L.Steinmetz, F.Ferrucci, A.Hirn (Inst. de Phys. du Globe, Univ. Pierre et Marie Curie, Paris, France), C.Morelli, R.Nicolich.
Geophys. Res. Lett. (USA), vol.10, no.6, p.428-31 (June 1983).
Six OBS deployed on a 550 km line in the Tyrrhenian Sea furnish reversed and overlapping profiles from 43 shots at 12 km intervals. Head waves recorded from a 8 km/s refractor, the Moho, permitted the computation of the crustal thickness, which shows this basin to be underlain by an oceanic type of crust, at least in two 100 km wide regions. Variations of Pn arrival times mirror strong topographical changes of the Moho. Differences in dips at the extremities towards Corsica and Calabria are documented. (12 refs.)

104287 The change in density in connection with metallization and the time required to form the Earth's metallic core. V.V.Nikolaichik (Schmidt Inst. for Phys. of Earth, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli,* vol.18, no.7, p.481-5 (1982).
Estimates of the energy of formation of the metallic core are made for a two-layered uncompressed Earth. It is shown that the value of the relative change in density in connection with metallization does not exceed 0.3 for the present core to have formed during the lifetime of the Earth. Growth of the core most probably took place with a relative density change of from 0.1 to 0.2. (7 refs.)

104288 The East Pacific Rise and the thermal model. B.T.R.Lewis (Geophys. Program & School of Oceanography, Univ. of Washington, Seattle, WA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3348-54 (10 April 1983). [received: Aug. 1983] (Anton L. Hales Symposium on 'Some Recent Advances in Geophysics', Dallas, TX, USA, 5-6 Oct. 1981).
Although the thermal mode of lithosphere cooling can be used to predict the East Pacific Rise topography reasonably well, it does not adequately predict the observed gravity when the zero temperature boundary condition is at the seafloor. The misfit arises primarily because this model predicts thermally lowered densities in the crust at the rise axis which counteract the gravitational effect of the topography, generating a theoretical gravity anomaly smaller than that observed. It is shown, using data at 12°N as an example, that improved agreement with the thermal model is obtained if, to first order, the crust is treated as an isothermal, constant thickness, constant density layer with variable depth. This result is consistent with observations of convective cooling of the crust by seawater circulation. It implies that convective cooling of the whole crust is very rapid. (13 refs.)

104289 Origin of Mesozoic and Tertiary granite in the western United States and implications for pre-Mesozoic crustal structure. I. Nd and Sr isotopic studies in the geocline of the northern Great Basin. G.L.Farmer, D.J.DePaolo (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3379-401 (10 April 1983). [received: Aug. 1983]
The Nd and Sr isotopic compositions of 25 Mesozoic and Tertiary bodies of granite (sensu lato) exposed in a 200-km wide transect of the northern Great Basin of the western United States have been determined. The purpose of the study was to combine the isotopic data with known aspects of the crustal structure and composition of a region extending from the continental margin to the interior craton and so determine the relative importance of mantle and crust as granite-magma sources as a function of distance from the continental margin. (110 refs.)

104290 Growth and dynamics of the Nordre Stromfjord shear zone. K.Sorensen (Dept. of Appl. Geology, Danish Tech. Univ., Lyngby, Denmark).
J. Geophys. Res. (USA), vol.88, no.B4, p.3419-37 (10 April 1983). [received: Aug. 1983]
The Nordre Stromfjord shear zone is exposed for a length of 170 km within the Precambrian Nagssugtoqidian Mobile Belt of West Greenland. Its western 100 km consists of a 15-20 km wide zone of syndeformational granulite facies rocks. The movement was sinistral with a displacement of 120 km across the zone. The strain across the shear zone margin increases exponentially but levels off to a near constant value over major sections of the inner zone. This profile suggests a growth model, in which the marginal zones are focii of instantaneous deformation that moves outward as hardening occurs along the inner boundaries and weakening occurs along the outer boundaries. This growth model allows the minimum possible viscosity change associated with the zone to be calculated from the logarithmic strain gradient and from the width across which weakening occurs. (35 refs.)

104291 Deep crustal geothermal measurements, hole 504B, Costa Rica Rift. K.Becker (Deep Sea Drilling Project, Scripps Inst. of Oceanography, La Jolla, CA, USA), M.G.Langseth, R.P.Von Herzen, R.N.Anderson.
J. Geophys. Res. (USA), vol.88, no.B4, p.3447-57 (10 April 1983). [received: Aug. 1983]
Reports and extensive suite of geothermal measurements in the deepest borehole yet drilled into the oceanic crust, hole 504B of the Deep Sea Drilling Project. Located in 6.2-m.y.-old crust of the Costa Rica Rift, hole 504B was cored during legs 69 and 70 in late 1979 and leg 83 in late 1981, to a total depth of 1350 m beneath the seafloor, through 274.5 m of sediment and 1075.5 m of basalt. During the three drilling legs, downhole temperatures were logged 11 times, and the thermal conductivities of 239 sediment and basalt samples were measured. The results indicate a dominantly conductive mode of heat transfer through the complete section, at 190±10 mW/m^2. This is consistent with the predicted plate heat transfer and the hypothesis that the thick sediment cover acts as a seal against hydrothermal circulation of seawater to basement. Seawater flow down the hole was observed. (46 refs.)

104292 Heat and mass transfer in a fault zone-controlled geothermal reservoir: numerical results. R.Pratt, D.R.Kassoy (Mech. Engng., Univ. of Colorado, Boulder, CO, USA), J.Gary.
J. Geophys. Res. (USA), vol.88, no.B4, p.3458-66 (10 April 1983). [received: Aug. 1983]
A model is described for planar geothermal reservoir charging by upflow in a permeable fault zone in the Earth's crust. Liquid water, heated at depth in basement materials, rises in the fracture system associated with the faulted region. When the fault is intersected by a horizontal layer of permeable material, charging of hot water into an adjacent aquifer can occur. The heat and mass transfer process for this system is defined in terms of natural and forced convection in a thermally active porous medium. Solutions to the basic mathematical model are obtained by finite-difference methods. The fluid mechanics and energy transport are resolved in both the narrow fault zone and the adjacent aquifer. (21 refs.)

104293 Effect of a Hadean terrestrial magma ocean on crust and mantle evolution. A.M.Hofmeister (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B6, p.4963-83 (10 June 1983).
Presents a model for the thermal and chemical evolution of a global magma ocean created by impact heating during the Earth's accretion. Detailed calculations are given for a melt depth of 120 km for end member picritic and peridotitic compositions. Application of fluid mechanics and heat transfer principles shows as a first approximation that the chemical evolution can be portrayed by idealized fractional crystallization occurring only on the bottom of the magma ocean. (60 refs.)

104294 Eruption age of a Pleistocene basalt from ^{40}Ar-^{39}Ar analysis of partially degassed xenoliths. A.R.Gillespie, J.C.Huneke, G.J.Wasserburg (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B6, p.4997-5008 (10 June 1983).
^{40}Ar-^{39}Ar dating has been applied to potassium-rich granitic xenoliths and host basalt from the Pleistocene Big Pine volcanic field, California. These xenoliths had been partially degassed upon their inclusion in the basaltic lava. Argon released from the xenoliths at extraction temperatures below ~900°C yielded plateau ages indistinguishable from the total K-Ar age of the basalt. The best estimate of the age of eruption was 1.18 m.y. The agreement of the low-temperature xenolith plateau ages and the basalt K-Ar ages demonstrates that ^{40}Ar-^{39}Ar analysis of xenoliths may be used to measure the age of eruption of very young lavas. This is significant because in many instances ages cannot be reliably determined by analysis of the lavas themselves. (27 refs.)

104295 Crustal structure in Izu Peninsula, central Japan, as derived from explosion seismic observations. I. Mishima-Shimoda profile. S.Asano, T.Yoshii (Earthquake Res. Inst., Univ. of Tokyo, Tokyo, Japan), S.Kubota, Y.Sasaki, H.Okada, S.Suzuki, T.Masuda, H.Murakami, N.Nishide, H.Inatani.
J. Phys. Earth (Japan), vol.30, no.5, p.367-87 (1982).
In December, 1979, a detailed explosion seismic experiment was conducted by Research Group for Explosion Seismology in the Mishima-Shimoda profile in Izu Peninsula, central Japan. The analysis of travel time data of good quality was made mainly by the time term method. The crustal structure derived revealed significant lateral heterogeneity especially around the middle of the profile. The comparison of the crustal structure with seismicity, gravity anomaly, crustal movement, and geology along the profile gives important results. (30 refs.)

104296 Quasi-static crustal deformations due to a surface load: rheological structure of the Earth's crust and upper mantle. T.Iwasaki, M.Matsu'ura (Geophys. Inst., Faculty of Sci., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Earth (Japan), vol.30, no.6, p.469-508 (1982).
Treats quasi-static displacement fields due to an axially symmetric load applied on the surface of a composite medium which consists of elastic layers overlying a stratified viscoelastic half-space. Integral representations of the surface displacements are obtained from those in the associated elastic problem by applying the correspondence principle of linear viscoelasticity. General features of the viscoelastic displacements are examined from various aspects through the computation of numerical examples for a three-layered model. Uplift phenomena in two tectonically different regions, Fennoscandia and Lake Bonneville (the Basin and Range province), are analyzed to investigate regional difference in rheological structure of the Earth's crust and upper mantle. (35 refs.)

104297 Microearthquake activity in the West Philippine Basin and northern Ryukyu Trench region as observed by ocean bottom seismometers at the Amami Plateau. K.Suyehiro, A.Nishizawa, H.Shimizu (Observation Center for Earthquake Prediction, Faculty of Sci., Tohoku Univ., Sendai, Japan).
J. Phys. Earth (Japan), vol.30, no.6, p.509-16 (1982).
There are several anomalous bathymetry highs in the West Philippine Basin which imply complex tectonic history of the region. They are the Amami Plateau, Daito Ridge, Oki Daito Ridge, and Kyushu-Palau Ridge. Seismic investigations at these regions to clarify local seismicity and structures may provide important clues to the understanding of their tectonic roles, which are not yet well known. The authors deployed a tripartite seismic array of OBSs on the Amami Plateau to investigate the microearthquakes activity in the vicinity and the crustal structure underneath using airgun seismic source. The authors concentrate on the results of microearthquake observations. The OBS experiment was carried out during the KH-82-4 cruise of R/V Hakuho of the University of Tokyo in July through August, 1982. (11 refs.)

104298 Delineation of New Zealand ultramafic rocks by computer processing of digital data from satellite imagery. R.R.Brooks (Dept. of Chem., Biochem. & Biophys., Massey Univ., Palmerston North, New Zealand), R.R.Brooks.
N.Z. J. Sci. (New Zealand), vol.26, no.1, p.65-71 (1983).
Computer processing of LANDSAT digital data was used to find the most effective delineation of ultramafic rocks in New Zealand. Each subscene was enhanced by histogram equalisation of bands MSS 4, 5, and 6 (500-600, 600-700, and 700-800 nm), and the data were written in blue, red, and green respectively on to positive colour film. Better delineation of ultramafic rocks was obtained with this procedure than with incorporation of the MSS 7 infrared band (800-1100 nm) or by use of the more usual technique of band ratioing. The rocks studied were from 4 segments of the Dun Mountain Ophiolite Belt (Dun Mountain, Red Mountain, D'Urville Island, and North Cape). The technique of satellite imagery developed in this study will be of practical application elsewhere in the world. (20 refs.)

104299 The relationship of the thickness of the oceanic lithosphere to the physical properties of the upper mantle. I.Lukashevich (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.313-17 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
A model is developed for the formation of the lithosphere based on cooling of partially molten material in the upper mantle, incorporating the release of latent heat of crystallization and changes in thermophysical properties during phase changes in the flowing asthenosphere. A theoretical value for the thickness of the lithosphere is obtained which is quite consistent with seismological data. The thickness of the lithosphere is calculated separately for three age intervals which correspond to the plagioclase, spinel and garnet phases of 1 herzolite. (14 refs.)

104300 Relationship between the heights of Pacific seamounts and the age of the lithosphere. N.A.Marova (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.322-4 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
The patterns of distribution of seamounts of different heights within the different age provinces of the Pacific Ocean floor and the East Pacific and South Pacific Rises were analyzed. The data obtained suggest that the height distribution of the underwater volcanic mountains is related to the age of the lithosphere of the Pacific Ocean, and that a relatively larger number of tall seamounts are present on the older zones of the lithosphere. (20 refs.)

104301 Density profile and modern crustal and uppermost mantle geotherm of the Voronezh crystalline massif. A.P.Tarkov (Dept. of Geology, Voronezh State Univ., Voronezh, USSR).
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.342-51 (July 1983).
A density profile and a modern temperature distribution in the lithosphere of the Voronezh crystalline massif (VCM) are derived through the use of the $V_P(z)$, $V_S(z)$ seismic velocity models, petrological data, measurements of V_P, V_S, density (ρ) and mean atomic weight ($\bar{m}$) for several groups of rocks and minerals of different composition and genesis, as well as from pressure and temperature derivatives for different thermodynamic regimes. (14 refs.)

104302 Fission tracks in minerals: Annealing kinetics, track structure and age correction. E.Bertel, T.D.Mark (Leopold Franzens Univ., Innsbruck, Austria).
Phys. & Chem. Miner. (Germany), vol.9, no.5, p.197-204 (1983).
It is shown that the annealing kinetics of fission tracks in apatite can be described by a sum of exponential decay functions. From an analysis of the temperature dependence of this annealing law it is concluded that the etchability of fission tracks is due to extended defects, i.e. systems of dislocation loops. The multiexponential annealing law is also applied to prove that the plateau correction method is basically correct, but rather as a method for determining a lower limit than the 'true' fission track age. (41 refs.)

104303 Alignment of volcanoes in the central volcanic region of Spain. E.Ancochea (Dept. de Petrologia, Univ. Complutense, Madrid, Spain), J.L.Brandle.
Rev. Geofis. (Spain), vol.38, no.2, p.133-8 (1982). In Spanish.
The possible lineations including the volcanoes of the Spanish 'Region Volcanica Central' have been looked at by means of a FORTRAN program. The most significant directions are N 105°-120°, N 160°-170°, so that the N 15°-20°, N 135°-155° and N 175°-185° represent lineations of secondary importance that reflect solely the pre-existing Hercynian fracturing. (11 refs.)

104304 Early Tertiary age of pitchstone in the northern Black Hills, South Dakota. J.A.Redden (South Dakota School of Mines & Technol., US Geological Survey, Rapid City, SD, USA), J.D.Obradovich, C.W.Naeser, R.E.Zartman, J.J.Norton.
Science (USA), vol.220, no.4602, p.1153-4 (10 June 1983).
A block of pitchstone in the northern Black Hills, South Dakota, is Paleocene in age, according to potassium-argon dating of biotite and fission-track dating of zircon in the sample. These data invalidate published suggestions that the age is much younger. The pitchstone is not extrusive in its present position but instead is in a volcanic pipe with other fragments that came downward from as much as 1100 meters above the modern surface. (9 refs.)

91.40 VOLCANOLOGY

104305 Observations of volcanic tremor at Mount St. Helens Volcano. M.Fehler (Geophys. Group, School of Oceanography, Oregon State Univ., Corvallis, OR, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3476-84 (10 April 1983). [received: Aug. 1983]
Digital recordings of ground motion during tremor episodes accompanying eruptions at Mount St. Helens Volcano in the state of Washington on August 7 and October 16-18, 1980, are studied. The spectra of the vertical component waveforms contain at least two dominant peaks at 1.0 and 1.3 Hz for all events recorded during both eruptions that were studied. Spectra of horizontal ground motion show peaks at 0.9 and 1.1 Hz. The relative amplitude of the two peaks changes between tremor episodes and during single tremor episodes and shows no consistent relation to amplitude of ground motion. Spectra of long-period earthquakes are very similar to those of tremor events, suggesting that tremor is composed of many long-period earthquakes that occur over a period of time. The unique waveform of tremor events observed at Mount St. Helens must be due to a source effect. (29 refs.)

104306 Magma reservoir subsidence mechanics: theoretical summary and application to Kilauea Volcano, Hawaii. M.P.Ryan (Branch of Igneous & Geothermal Processes, US Geological Survey, Reston, VA, USA), J.Y.K.Blevins, A.T.Okamura, R.Y.Koyanagi.
J. Geophys. Res. (USA), vol.88, no.B5, p.4147-81 (10 May 1983).
An analytic model has been developed for the prediction of the three-dimensional deformation field generated by the withdrawal of magma from a sill-like storage compartment during an intrusion or eruption cycle. The model is based on the work of Berry and Sales (1961, 1962) and predicts the vertical displacement components over the areal plane. Systematic variation in model parameters within the context of Kilauea Volcano, Hawaii, have revealed that circular and elliptical deformation patterns result from the collapse of draining rectilinear intrusions at depth. Moreover, the geometric parameters of a storage compartment may interact in complex ways to produce similar deformation patterns. The model has been applied to Kilauea Volcano for three periods of pronounced summit subsidence. (57 refs.)

91.45 PHYSICS OF PLATE TECTONICS

104307 Visco-elastic interpretation of sedimentary subsidence. J.Virieux (Univ. Paris VI, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1061-6 (18 April 1983). In French.
The visco-elastic response of a flat thin lithosphere overlying an inviscid fluid and loaded by a sedimentary weight is studied. Analytical and integral solutions are developed for line sources and point sources, emphasizing the similarities. Thereafter a strategy for evaluating sedimentary deflections is proposed in order to compute the tectonic subsidence, one of the main pieces of information about tectonic basin formation and evolution. (15 refs.)

104308 Submerged Pliocene of the south eastern margin of Gavdos Island (eastern Mediterranean): tectonic implications. G.Glacon (Univ. Pierre et Marie Curie, Paris, France), H.Got, A.R.Larsen, A.Monaco, C.Muller, A.Murat.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1199-202 (25 April 1983). In French.
Occurrence of littoral and hemipelagic Pliocene sediments in three piston cores retrieved from a depth of 1600 to 2500 m allows the assumption that the margin has been foundering since the Late Pliocene (NN 17-MPL6). This hypothesis is consistent with the extensive structures observed on seismic reflection profiles of the inner wall of the Hellenic Trench. (18 refs.)

104309 Middle Miocene synsedimentary tectonic structures near Budapest: Evidence for extensional processes within the Pannonian Basin. F.Bergerat, J.Geyssant (Univ. Pierre-et-Marie-Curie, Paris, France), M.Kazmer.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1275-8 (2 May 1983). In French.
Synsedimentary tectonics that created remarkable patterns of NE-SW tension gashes have affected the Badenian strata near Budapest. Ridges of oomicrite bind these fissures and correspond to early cementation that occurred contemporaneously with sedimentation. The creation of these tension gashes is connected with the opening of the Pannonian Basin and, in detail, is interpreted as the earlier stage of an extensional process that leads to development of larger normal faults. (4 refs.)

104310 Importance of Mesozoic nappe structure tectonism in Central and Southern Japan. J.Charvet, J.-P.Cadet (Univ. d'Orleans, Orleans, France), M.Faure, J.Aubouin.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1279-86 (2 May 1983). In French.
Several nappes were emplaced during the Mesozoic tectonism in the Tamba zone and in the Sambagawa-Chichibu domain. In the Tamba zone, units composed mainly of sedimentary material, including a Jurassic olistostrome superimposed. In the Sambagawa Chichibu realm, south verging metamorphic and sedimentary thrusts are emplaced during the second deformation phase. The building of all these structures is suggested to be the result of a collision between at least two continental blocks: a northern one (Hilda) and a southern one (Kurosegawa). (45 refs.)

104311 Origin and emplacement of ophiolites from Western Alps: comparison with oceanic structures. J.-M.Auzende, R.Polino, Y.Lagabrielle, J.-L.Olivet.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1527-32 (30 May 1983). In French.
The authors suggest that some ophiolites of the 'Schistes Lustres Nappe' (Western Alps) originated from oceanic massives thrusted and tectonically incorporated into the ocean sediments during early compressive events. This interpretation is supported by field observations and oceanic data. (21 refs.)

104312 The North-Magne Shear Zone: a transverse fault zone of the Outer Hellenic Arc (South Peloponnesus, Greece). S.Lallemant, N.Lyberis, F.Thiebault (Dept. de Geotectonique, Univ. Pierre-et-Marie-Curie, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1545-50 (30 May 1983). In French.
The North-Magne fault zone cutting through the Peloponnesus Alpine orogenic belt and the present continental margin extends out to the Hellenic Trench. This lineament is marked, on land, by polyphased fault populations. A left lateral movement was followed by a normal faulting mechanism. The strike slip motion is related to East-West trending folds present in the surrounding area. This compressive event clearly follows the nappe emplacement, and is considered as Late Serravalian-Early Tortonian in age. The extensional event is Late Miocene-Plioquaternary in age. (22 refs.)

104313 Stokes flow between parallel plates due to a transversely moving end wall. J.F.Harper, G.C.Wake (Math. Dept., Victoria Univ. of Wellington, Wellington, New Zealand).
IMA J. Appl. Math. (GB), vol.30, no.2, p.141-9 (March 1983).
Considers the two-dimensional Stokes flow in a semi-infinite strip of viscous fluid due to a transverse velocity of its end wall. This is an idealization of the motion in the asthenosphere due to a subducting slab. The authors give an iterative scheme for calculating the flow, prove existence and uniqueness, and obtain numerical approximations, using developments of Teodorescu's method (1960) and an approximate solution of the infinite matrix equation arising therein. (Simple truncation to finite order is not good enough.) The boundary conditions give rise to singularities which prevent other known methods (including the original form of Teodorescu's) from working. The solution reveals how surprisingly good an approximation its asymptotic forms near the corners and at infinity are in most of the flow field. (30 refs.)

104314 The graphical simulation of tectonic plate motion. M.R.Saunders, P.R.Miles (Inst. of Oceanographic Sci., Wormley, Godalming, England), M.W.Storey.
Comput. & Geosci. (GB), vol.9, no.2, p.245-54 (1983).
LANDROT is a computer program written for the Natural Environment Research Council Honeywell 66/60 Computer to simulate landmass paleomovement by the rotation of geographic outlines about poles of rotation on the Earth's surface. The output is a plot using the NERC GRAFIX subroutine library with optimal projections. (2 refs.)

104315 Speculations on the Mesozoic plate tectonic evolution of eastern China. M.P.Klimetz (Dept. of Geological Sci., State Univ. of New York, Albany, NY, USA).
Tectonics (USA), vol.2, no.2, p.139-66 (April 1983).
Several orogenic belts transecting eastern China are the sites of former convergent plate margins, although there have been varying views on the collisional framework of individual continental blocks, styles of convergence at these zones, and the timing of respective collisions. A tectonic study of eastern China, Mongolia and the southern Soviet Far East indicates the collision of the South China Block with a combined North China-Northeast China Fold Zone Block in the Late Triassio-Early Jurassic, their collective suturing to Eurasia in the Late Jurassic-Early Cretaceous, followed by the Sikhote Alin-Japan Block in the Mid to Late Cretaceous. The evidence is presented. (142 refs.)

104316 Tectonic analysis of the Dead Sea Rift region since the Late-Cretaceous based on mesostructures. Y.Eyal (Dept. of Geology, Ben-Gurion Univ., Beer-Sheva, Israel), Z.Reches.
Tectonics (USA), vol.2, no.2, p.167-85 (April 1983).
Measures the orientations of small faults, slickensides, tectonic stylolites, vein with secondary mineralization, small folds and dikes in Israel and Sinai. These structures are indicators of paleo-stress or strain and provide the pattern of tectonic deformation. The authors define two tectonic stress fields, each relatively uniform in both time and space. One stress field, with dominating maximum horizontal compression trending W to WNW, in the Late Cretaceous to Eocene rocks in the folds and plateaux west of the Dead Sea Rift. The second field, with dominating horizontal extension trending E to ENE, in all rocks inside the rift and proximal thereto. (43 refs.)

104317 A model for the crustal evolution of southern Scotland. J.K.Leggett (Dept. of Geology, Imperial Coll., London, England), W.S.McKerrow, N.J.Soper.
Tectonics (USA), vol.2, no.2, p.187-210 (April 1983).
Briefly reviews existing geological and geophysical evidence concerning deep crustal structure. The authors compare the likely geometries of the Early Palaeozoic Scottish (American), and English (northern European) continental margins with the modern margins. The authors consider seismic refraction profiles. (63 refs.)

104318 Accreted terranes in the northern part of the Philippine Archipelago. D.E.Karig (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).
Tectonics (USA), vol.2, no.2, p.211-36 (April 1983).
Discusses the tectonic framework of the N Philippines. The framework remains incomplete because of a paucity of information in some areas. The region under study (Luzon, Mindoro, Marinduque and interspersed smaller islands) consists of at least 6 terrains. (95 refs.)

104319 An analysis of a possible episodic plume trace in West Africa. D.E.Ajakaiye, P.J.T.Verheijen (Dept. of Phys., Ahmadu Bello Univ., Zaria, Nigeria).
Geophys. Res. Lett. (USA), vol.10, no.6, p.424-7 (June 1983).
The evolution of a plume trace which constitutes the granitic intrusives in the Hoggar, Air, Zinder and the Jos plateau regions has been analyzed using geochromological and topographic data. The trace location is consistent with the idea of the African plate rotating around a pole in West Africa located at about 1.0°W and 13.9°N with an angular velocity of about 0.216 degrees/my during the Cambrian to the Jurassic period, possibly with a small deceleration. The major activity seems to occur at intervals of 125±6 my. (14 refs.)

104320 Relationship between present and most recent movements of the Earth's crust and depth of the basement of the East European platform. V.V.Bronguleev, A.F.Grachev, I.V.Kalashnikova, V.A.Magnitskiy (O.Yu. Schmidt Inst. of Phys. of Earth, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.4, p.255-63 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.4 (1982).
Correlation analysis of the depths of the basement, the amplitudes of the most recent and the velocities of contemporary crustal movements in the East European platform as well as a trend analysis of these parameters are used to discuss tectonic crustal movements. (19 refs.)

104321 The subduction of young lithosphere. I.S.Sacks (Dept. of Terrestrial Magnetism, Carnegie Inst. of Washington, Washington, DC, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3355-66 (10 April 1983). [received: Aug. 1983] (Anton L. Hales Symposium on 'Some Recent Advances in Geophysics', Dallas, TX, USA, 5-6 Oct. 1981).
Studies, using a variety of techniques, of the subduction beneath western South America and the southwest Honshu-Kyushu region of Japan indicate that volcano-free segments occur where the subducted and continental lithospheres remain in contact without intervening asthenosphere. The subduction is initiated at normal dip angles, but the plate deforms at some depth to travel horizontally immediately beneath continental lithosphere. The most plausible reason for this geometry is that the subducted plate is buoyant. A model is developed constrained by age of the plate, bathymetry, and heat flow. Estimates of the density of oceanic plates as a function of age show that younger ocean floor may be less dense than the asthenosphere into which it subducts. If the high-density transformation of crustal basalt to eclogite is retarded by low temperatures, the plate can remain buoyant to considerable depth for long periods of time. (39 refs.)

104322 Wandering terranes in southern Alaska: the Aleutia microplate and implications for the Bering Sea. M.S.Marlow, A.K.Cooper (US Geological Survey, Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3439-46 (10 April 1983). [received: Aug. 1983]
The tectonic evolution of southern Alaska, the Aleutian arc and the Bering Sea areas are studied. Much of southern Alaska is a collage of tectonostratigraphic terranes which originated in Mesozoic time at paleolatitudes far south of their present position. The time of 'docking' of the terranes against cratonic Alaska is critical to defining their amalgamated size and extent during their northward motion as well as their role in the evolution of the Bering Sea. One of the largest of the tectonostratigraphic terranes, the Peninsular terrane of south central and southwestern Alaska, extends offshore along the outer Bering Sea continental margin (Beringia). Paleomagnetic data suggest that this terrane has moved northward through all of Cenozoic time, but geologic data imply that the terrane had accreted to Alaska by the end of the Mesozoic. Two accretion models, based on docking times for terranes in Alaska, are proposed, and they illustrate that large areas of the abyssal Bering Sea, the Alaska Peninsula, the Aleutian arc, and the Beringian continental margin may be part of a superterrane or microplate called Aleutia. (68 refs.)

104323 Error analysis for the determination of tectonic rotation from paleomagnetic data. H.H.Demarest,Jr. (Dept. of Geology, Oregon State Univ., Corvallis, OR, USA).
J. Geophys. Res. (USA), vol.88, no.B5, p.4321-8 (10 May 1983).
Recent determinations of tectonic rotation and flattening from paleomagnetic data have exaggerated the size of the confidence limits or error bars by about 25%. This has been caused by the misuse of conventional error propagation formulas to derive one degree of freedom error bars from a two dimensional cone of confidence (α_{95}). An analytical calculation, which is valid when error bars are small, shows that the correct error bars are 75% to 80% of the values derived in previous studies. The present author used numerical integration to check on the applicability of the analytical solution and to calculate error bars when the analytical approximation cannot be used. The analytical approximation may be used whenever α_{95} is less than 10° and the mean inclination is not too close to vertical. Confidence limits given for tectonic rotation and flattening in recent literature are too large and should be reduced by 20-25%. (17 refs.)

104324 A dislocation model of strain accumulation and release at a subduction zone. J.C.Savage (US Geological Survey, Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B6, p.4984-96 (10 June 1983).
Strain accumulation and release at a subduction zone are attributed to stick slip on the main thrust zone and steady aseismic slip on the remainder of the plate interface. This process can be described as a superposition of steady state subduction and a repetitive cycle of slip on the main thrust zone, consisting of steady normal slip at the plate convergence rate plus occasional thrust events that recover the accumulated normal slip. Because steady state subduction does not contribute to the deformation at the free surface, deformation observed there is completely equivalent to that produced by the slip cycle alone. The response to that slip is simply the response of a particular Earth model to embedded dislocations. For a purely elastic Earth model, the deformation cycle consists of a coseismic offset followed by a linear-in-time recovery to the initial value during the interval between earthquakes. For an elastic-viscoelastic Earth model the postearthquake recovery is not linear in time. (32 refs.)

104325 Constraint on deep mantle viscosity from Lageos acceleration data. W.R.Peltier (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Nature (GB), vol.304, no.5925, p.434-6 (4 Aug. 1983).
Recently reported analyses of $5^1/_2$ yr of orbital data for the laser geodynamics satellite (Lageos) have revealed a residual acceleration in the node of its orbit in the amount -14.7 ± 1.3 m arc s yr^{-2}. This acceleration is predominantly attributable to a secular decrease of the degree two component of the Earth's gravitational potential field J_2. The implied rate of change of J_2 is $(-3.5\pm0.3)\times10^{-11}$ yr^{-1}. The following analysis argues that this effect is due to Pleistocene deglaciation and that it can be used to constrain strongly the viscosity of the Earth's deep mantle. (14 refs.)

104326 Destabilization of a 650 km chemical boundary layer and its bearing on the evolution of the continental crust. C.T.Herzberg, R.D.Forsythe (Dept. of Geological Sci., Rutgers Univ., New Brunswick, NJ, USA).
Phys. Earth & Planet. Inter. (Netherlands), vol.32, no.4, p.352-60 (July 1983).
A mechanism for the production of a chemical change in the mantle, from primordial silicate compositions above the 650 km discontinuity to differentiated compositions below, is reviewed. Some consequences of this are the stabilization of two layer convection with a temperature contrast between the anhydrous mantle solidus and the geotherm which, at 650 km depth, is lower than any other location in the mantle. With thermal contributions from the concentration of the heat producing elements U, Th and K below the 650 km mantle boundary layer and the higher geotherms in the past, widespread or catastrophic melting may have taken place at this location. An episodic breach of this boundary layer by extensive heat and mass transport may have periodically destroyed any simple two-layer convection geometry in the mantle. Such episodic injections of mass and energy into the upper mantle from below may have been in the mechanism responsible for episodes of enhanced surface tectonism. (45 refs.)

104327 Geodynamic aspects of the Mediterranean-Alpine region. S.Mueller (Inst. fur Geophys., ETH-Honggerberg, Zurich, Switzerland).
Rev. Geofis. (Spain), vol.38, no.2, p.103-11 (1982). In English.
The geodynamic processes in the Mediterranean-Alpine region are primarily governed by the relative movement of the African plate against the Eurasian plate resulting in a predominantly compressional regime and leading to lithospheric shortening (~6 to 7 mm/year) and rifting in pre-conditioned zones of weakness. The boundary between these two major plates as defined by the present seismicity is rather complex. It extends all the way into the Alps due to the presence of the 'Adriatic promontory' of the African plate, thus providing an explanation for the collision structure of the Alps in this particular location. In the still ongoing plate collision process the lower lithosphere seems to have been subducted to depths of about 220-250 km. The continuing uplift of the Alpine mountain chain is due to isostatic adjustment of the heavily deformed upper portions of the 'lithospheric root' under the Alps. (17 refs.)

104328 Rotational deformation of an elastic Earth. M.J.Sevilla, A.Gonzalez Camacho (Catedra de Astron. y Geodesia, Univ. Complutense, Madrid, Spain).
Rev. Geofis. (Spain), vol.38, no.2, p.179-87 (1982). In Spanish.
The changes in the Earth's inertial tensor due to the rotational deformation are studied and some equations for these changes are obtained. (10 refs.)

104329 Crustal movement. L.Brown, R.Reilinger (Cornell Univ., Ithaca, NY, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.553-9 (April 1983).
Reviews the Southern California Uplift, the San Andreas transform system, earthquake deformations, magma induced deformation, the NW United States, subsidence due to fluid withdrawal, the E United States, and diagnosis and prognosis. (51 refs.)

91.50 MARINE GEOLOGY AND GEOPHYSICS

104330 Petrologic and geochemical variations along the Mid-Atlantic Ridge from 29°N to 73°N. J.-G.Schilling, M.Zajac, R.Evans, T.Johnston, W.White, J.D.Devine, R.Kingsley (Graduate School of Oceanography, Univ. of Rhode Island, Kingston, RI, USA).
Am. J. Sci. (USA), vol.283, no.6, p.510-86 (June 1983).
Reports a comprehensive petrological and geochemical study of basalts dredged at regular intervals along the axis of the Mid-Atlantic Ridge from 29°N to 73°N. The results show that the influence of unusual processes occurring beneath the Jan Mayer, Iceland, and Azores shallow volcanic plateaus is reflected not only in the morphology and tectonics but also in the geochemistry and petrology of MAR basalts erupted in these regions. The data suggest that the mantle beneath these hotspots is enriched in large incompatible elements, H_2O and halogens. (148 refs.)

104331 A geologic consideration on the southern part of the East China Sea continental shelf. T.P.Yen (Nat. Central Univ., Chungli, Taiwan).
Bull. Geophys. (Taiwan), no.24, p.17-29 (March 1983).
The submarine geology of the southern part of the East China Sea continental shelf is considered based on the free-air gravity map, magnetic map and seismic stratigraphic records. The rock formations in this region seem to be arranged in zonal structure trending NE direction and the basement surfaces show basins and ridges (or plateaus) in alternation. The rock formations may include the Paleozoic/metamorphic, Mesozoic, Paleogene, Neogene and Quaternary formations, and the continuities of the strata sequences seem to be interrupted in many areas due to presence of unconformities. The thickness of the strata above the 6.0 km/sec layer in the southern area is commonly greater than that in the northern area. (10 refs.)

104332 Surface expressions of bathymetry on SEASAT synthetic aperture radar images. D.W.S.Lodge (Space & New Concepts Dept., Royal Aircraft Establ., Farnborough, England).
Int. J. Remote Sens. (GB), vol.4, no.3, p.639-53 (July-Sept. 1983).
Identifies three classes of feature observed on SEASAT synthetic aperture radar images that may be related to changes in water depth. The first if refraction of gravity waves. The second is the modulation of the surface roughness as tidal currents flow over changes in the depth of shallow water. The third is the detection of internal waves propagating from steep gradients in deep water. (7 refs.)

104333 A FORTRAN program for suspended sediment dynamics and tidal flux monitoring. A.P.Belperio (Geology Dept., Univ. of Adelaide, Adelaide, Australia), J.McManus, P.H.Cohen.
Comput. & Geosci. (GB), vol.9, no.2, p.221-7 (1983).
Research into estuarine and coastal fine sediment transport and sediment deposition is aided by a proposed routine for collection and analysis of hydrodynamic, particulate, and salinity data. Field measurements taken over a number of depth intervals and over one or more tidal cycles are used to calculate the point, depth-integrated, and net horizontal movements of water, suspended solids and salt at a fixed sampling site. (9 refs.)

104334 The East Pacific Rise near 21°N, 13°N and 20°S: inferences for along-strike variability of axial processes of the Mid-Ocean Ridge. J.Francheteau (Centre Oceanologique de Bretagne, Brest, France), R.D.Ballard.
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.93-116 (July 1983).
Data obtained along various segments of the Mid-Ocean Ridge (MOR) are used to construct an idealized model for crustal accretion. The model seeks to predict the topographic, volcanic, tectonic, and hydrothermal characteristics of any given spreading segment of the MOR as a function of distance from the bounding transform faults. This model is based on a series of detailed mapping efforts carried out on segments of the MOR having a broad range of spreading rates between 2 and 16 cm/yr. (74 refs.)

104335 Bathymetry estimates in the southern oceans from Seasat altimetry. T.H.Dixon, M.E.Parke (Jet Propulsion Lab., Pasadena, CA, USA).
Nature (GB), vol.304, no.5925, p.406-11 (4 Aug. 1983).
A mean sea surface height based on Seasat altimeter data has been high-pass filtered to reveal a pattern of geoid anomalies which are highly correlated with sea-floor topography. The technique is used to locate new bathymetric features in the poorly surveyed southern oceans. (27 refs.)

104336 Areas of distribution of different types of recent marine sediments. O.K.Leont'yev, M.B.Belodedenko (Univ. of Moscow, Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.318-21 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
On the basis of maps of ocean-bottom sediments published in the Soviet Union and abroad, a map of the bottom oceanic sediments has been compiled in the Laboratory of Marine Geomorphology of the Geography Faculty of Moscow University in a novel Werner-Murevskis equal-area projection (scale 1:20,000,000). An electronic planimeter was then used to calculate the areas of distribution of different genetic types of recent marine sediments. The data obtained significantly improved the data on the areas of distribution of marine sediments, presented in the widely-known work of Sverdrup, Johnson & Fleming (1942). (18 refs.)

91.60 PHYSICAL PROPERTIES OF ROCKS AND MINERALS

104337 Pore size distribution of shaly rock by small angle neutron scattering. P.L.Hall, D.F.R.Mildner (Res. Reactor Facility, Univ. of Missouri, Columbia, MO, USA), R.L.Borst.
Appl. Phys. Lett. (USA), vol.43, no.3, p.252-4 (1 Aug. 1983).
Information concerning pore microstructure of shaly rocks is of considerable relevance to petroleum exploration and production. Pore sizes and distributions within shaly samples have been determined by small angle neutron scattering. The data are indicative of a considerable spread of pore dimension, showing inhomogeneities with a range from 20 Å and greater. The cumulative pore volumes are compared with those derived from mercury intrusion porosimetry and nitrogen adsorption and desorption isotherms. (22 refs.)

104338 Thermomagnetic characteristics in late orogenic granites and gneisses of the southern Appalachian Piedmont. F.C.Davison,Jr. (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY USA), B.B.Ellwood.
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.117-22 (July 1983).
Thermomagnetic curves have been obtained for samples from 25 granites and gneisses in Georgia, South Carolina, and North Carolina. This data set can be divided into two distinct curve types: Type I includes rocks which exhibit no distinct Curie points and a linear decrease in magnetization with increasing temperature; Type II curves exhibit a distinct Curie point over a range of temperatures expected for magnetite (500-580°C). The data are interpreted as indicating that Type I thermomagnetic curves are dominated by relatively large hematite/magnetic ratios while Type II granites are characterized by relatively coarse-grained magnetite. (21 refs.)

104339 Diffusion between olivine and spinel: application to geothermometry. J.Lehmann (CRSCM, GIS, CNRS-BRGM, IA, Orleans, France).
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.123-38 (July 1983).
Heating experiments were carried out, at 1100°C and 1200°C under controlled oxygen fugacity, on olivine-spinel assemblages from New Caledonia. The result was a marked change in chemical composition of the minor phase, olivine: it becomes enriched in iron and chromium and the magnesium and nickel contents decrease. The results show the possibility of an important subsolidus re-equilibration in natural assemblages containing olivine and spinel. A new equation for the geothermometer based upon Fe^{2+}-Mg^{2+} partitioning between olivine and spinel is proposed and some applications discussed. (22 refs.)

104340 A model for the high-frequency electrical response of wet rocks. P.C.Lysne (Sandia Nat. Labs., Albuquerque, NM, USA).
Geophysics (USA), vol.48, no.6, p.775-86 (June 1983).
In experiments on the electrical properties of rocks at high frequencies, the measured current has contributions from both conduction and displacement currents, and these are related to the bulk conductivity and dielectric permittivity, respectively. In the present model, the bulk electrical conductivity of a specimen is taken to be a constant given by Archie's (1942) rule, whereas its frequency-dependent permittivity is taken to be a generalization of Sillars' (1937) model of a composite dielectric. (33 refs.)

104341 Effect of the conditions of synthesis and heat-treatment regime on the magnetic properties of iron sulfides with a Curie temperature of 570°C. A.G.Zvegintsev, V.V.Onufriyenok, M.I.Petrov (L.V. Kirenskiy Inst. of Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.4, p.298-300 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.4 (1982).
The magnetic properties and crystalline structure were studied in iron sulfides with a Curie temperature of 570°C. Mossbauer and X-ray studies were conducted for this phase at different temperatures. Conditions of synthesis were determined, as well as the regions for the stable and metastable states of the ferromagnetic phase with T_C=570°C. Magnetic measurements were made in a wide range of temperatures (4.5-860K) and magnetic fields (0-70000 oersteds). (6 refs.)

104342 Temperature conductivity of calcite, hornblende and crystalline shale at a pressure of up to 8 GPa. Yu.A.Sorokin, L.N.Dzhavadov, Yu.S.Genshaft (O.Yu. Schmidt Inst. of Phys. of Earth, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.4, p.301-3 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.4 (1982).
Thermal conductivity of calcite, hornblende (hastingsite) and garnet-pyroxene-plagioclase schist, is measured at high pressures of up to 8 GPa at room temperature. There is an appreciable change of temperature-conductivity of calcite in the pressure range of 0.5-2.0 GPa, due to polymorphic transformations. The character of the change in thermal conductivity of hornblende and schist is the same, namely, a sharp increase in the initial pressure range of 0.5-0.7 GPa and a gradual increase for a further compression up to 8 GPa. (15 refs.)

104343 Low temperature heterophase alteration of titanomagnetite in oceanic basalts based on magnetic data. D.M.Pecherskii, L.V.Tikhonov (Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.7, p.506-13 (1982).
The magnetic properties of basalts from site 504B of the DSDP are investigated. It is shown that alongside single-phase oxidation, low temperature heterophase oxidation and decomposition of titanomagnetite takes place. It increases with depth and is related to superimposed heating of basalts at temperatures of the order of 100°C. Data on magnetic properties of oceanic basalts are correlated with the anomalous magnetic field over them. A number of features are attributed to single- and heterophase titanomagnetite alteration processes. (12 refs.)

104344 Magnetic properties and composition of ferromagnetic phases of basalts recrystallized at high temperatures and pressures. Yu.S.Genshaft, M.M.Sattarov (Schmidt Inst. of Earth Phys., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.7 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.7, p.514-19 (1982).
Investigates the magnetic characteristics of basalt and the compositions of the ore-mineral phases crystallizing in the pressure region of 4-13 kbar at high temperatures and oxygen fugacity close to NNO buffer. A substantial change in the composition of magnetite in the pressure region up to 8 kbar has been determined. Conditions of crystallization of ore-mineral phases in original samples corresponding to a depth near the continental Moho surface have been assessed. (12 refs.)

104345 Phase transitions and equations of state for the sodium halides: NaF, NaCl, NaBr, and NaI. Y.Sato-Sorensen (Dept. of Geological Sci., Harvard Univ., Cambridge, MA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3543-8 (10 April 1983). [received: Aug. 1983]
Phase changes and equations of state of four sodium halides, NaF, NaCl, NaBr, and NaI, have been studied up to $\sim$60 GPa at room temperature. NaF and NaCl transform from the B1 phase to the B2 phase at $\sim$23 GPa and $\sim$29 GPa, respectivity. At $\sim$33 GPa, NaBr transforms from the B1 phase to an unidentified phase with a lower symmetry than the B2 phase. NaI also transforms at $\sim$32 GPa to a new phase which seems to have the same structure as that of the high-pressure phase of NaBr. The bulk modulus of the NaF B2 phase was measured. Volume changes across transitions were also measured. (32 refs.)

104346 Anharmonicity of three minerals at high temperature: forsterite, fayalite, and periclase. O.L.Anderson, I.Suzuki (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3549-56 (10 April 1983). [received: Aug. 1983]
Recent data on K_S (the adiabatic bulk modulus) and α (the volume coefficient of thermal expression) versus T (temperature) at high temperatures ($500°C<T<1000°C$) have been published or are in press. The high temperature anharmonic properties of forsterite and fayalite are presented for the first time in this paper, and they are compared with similar previously published data for MgO. The anharmonic properties referred to above concern the dependence of γ (the Gruneisen ratio), P_{TH} (the thermal pressure), and C_V (the specific heat) with T. If γ (at constant V) is independent of T at high T, the anharmonicity in γ is said to be nil; similarly, for C_V. If P_{TH} at constant V is proportional to T at high T, then the anharmonicity in P_{TH} is said to be nil. The anharmonicity determined by these experiments indicates that the minerals are not alike with regard to their properties γ, P_{TH}, and C_V. (18 refs.)

104347 A semiempirical method for analysis of the reflectance spectra of binary mineral mixtures. P.E.Johnson (Wyoming Infrared Obs., Dept. of Phys. & Astron., Univ. of Wyoming, Laramie, WY, USA), M.O.Smith, S.Taylor-George, J.B.Adams.
J. Geophys. Res. (USA), vol.88, no.B4, p.3557-61 (10 April 1983). [received: Aug. 1983]
A simple semiempirical method is presented for determination of the spectral reflectance of a powdered binary mineral mixture. This technique uses a two-stream radiative transfer model (a modified Kubelka-Munk model) on a particulate medium of isotropic scatterers. The particles are assumed to be much larger than the wavelength of light under consideration. This same method can be used to determine the relative proportion of components in a mixture for which the spectral reflectance is known. Binary mixtures of olivine, two pyroxenes, and magnetite are used to test this model. The theoretical and empirical results agree approximately within experimental errors. (13 refs.)

104348 Measurements of frictional heating in granite. D.A.Lockner, P.G.Okubo (US Geological Survey, Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.B5, p.4313-20 (10 May 1983).
A large ($150\times150\times40$ cm) granite sample, sawn diagonally in half to simulate a fault, was deformed in a biaxial rock press at normal stress up to 6.41 MPa. Displacements and local shear stress were monitored along the fault (200×40 cm). Temperature transients as large as 10 m°C were recorded following stick slip events at distances of 0.2 to 1.0 cm from the fault and were related to stress, displacement, and total work. The temperature measurements were used to calculate the heat generated on the fault during slip. Frictional heating was found to be 94±2% of the total work expended in each event, implying a seismic efficiency of 4-8%. When water was injected onto the fault, both frictional stress drop and static frictional stress increased. (24 refs.)

104349 Stress corrosion and crack propagation in Sioux quartzite. L.Peck (Dept. of Geology & Geophys., Yale Univ., New Haven, CT, USA).
J. Geophys. Res. (USA), vol.88, no.B6, p.5037-46 (10 June 1983).
Two aspects of the brittle deformation of Sioux quartzite have been studied: water-induced changes in the amount of energy consumed during fracture of the quartzite and the occurrence of microcracking during crack propagation. Wedge-loaded double cantilever beam test specimens were cracked in several environments (air, water, aqueous solutions of NaOH, HCl, NaCl, methanol) at crack velocities of 4.2×10^{-2} mm/s and 4.2 mm/s and temperatures of 17°-60°C. The fracture experiments measured the fracture energy of the quartzite, the specific energy required to produce a unit increment of crack extension, using the analysis of linear elastic fracture mechanics. The fracture energy of Sioux quartzite in water is 15% lower than that of quartzite cracked in air. The dependence of the quartzite fracture energy on crack velocity (time) and on the concentration of water in the test environment is characteristic of the occurrence of stress corrosion as a mechanism of enhanced crack growth in the presence of water. (47 refs.)

104350 Magnetic properties of three segments of the Mid-Atlantic Ridge at 37°N: FAMOUS, Narrowgate, and AMAR: AMAR 2. N.A.van Wagoner (Dept. of Geology, Dalhousie Univ., Halifax, Nova Scotia, Canada), H.P.Johnson.
J. Geophys. Res. (USA), vol.88, no.B6, p.5065-82 (10 June 1983).
During the AMAR 1978 Expedition, over 200 separate basalt samples were collected by Alvin and dredge from the Narrowgate and AMAR segments of the Mid-Atlantic Ridge near 37°N to determine the origin of reversely magnetized rocks previously recognized in the FAMOUS rift area to the north and to study the variations in rock magnetic properties that occur along the strike of the Mid-Atlantic Ridge. Magnetic intensity determinations of rocks collected in the FAMOUS area indicate that intensity decays with time by a factor of 5 in less than 10^6 years. Rocks with low intensities have high Curie temperatures (T_c) indicating that low-temperature oxidation of the magnetic minerals takes place soon after the basalts are extruded and is pervasive in crust older than 10^6 years. Magnetic intensity (J_{nrm}) of the uppermost oceanic crust can be expressed as a function of age (t) by the expression $J=5.82t^{-1/3}$. (66 refs.)

104351 Thermodiffusional transport in pelagic clay: implications for nuclear waste disposal in geological media. E.C.Thornton, W.E.Seyfried,Jr. (Dept. of Geology & Geophys., Univ. of Minnesota, Minneapolis, MN, USA).
Science (USA), vol.220, no.4602, p.1156-8 (10 June 1983).
Thermal gradient experiments in sediment-seawater systems revealed large-scale fluxes of aqueous electrolytic components away from the heat source through thermal diffusion. These findings indicate a need for similar studies in other geological materials of low permeability in order to assess the implications of this phenomenon for various nuclear waste disposal options. 91.65 GEOPHYSICAL ASPECTS OF GEOLOGY, MINERALOGY AND PETROLOGY

104352 Oxygen isotopic compositions of Central Andean plutonic and volcanic rocks, latitudes 26°-29° south. F.J.Longstaffe (Dept. of Geology, Univ. of Alberta, Edmonton, Canada), A.H.Clark, R.H.McNutt, M.Zentilli.
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.9-18 (July 1983).
Oxygen isotope data are reported for 27 igneous rocks of Mesozoic to Quaternary ages from the Central Andes, 26-29°S. The plutonic rocks and most of the volcanics, have $\delta^{18}O$ values between 6.2 and 8.3%. The whole-rock $\delta^{18}O$ values show a weak correlation with initial $^{87}Sr/^{86}Sr$ data. The oxygen isotope results indicate that the magmas evolved without significant contamination from supracrustal rocks (e.g. rocks that experienced ^{18}O enrichment during surficial weathering). The available O, Sr and Pb isotopic data for these rocks are best explained by magma generation in the upper mantle or lower crust. (47 refs.)

104353 The chronology of intermontane-basin development in the northwestern Himalaya and the evolution of the Northwest Syntaxis. D.W.Burbank (Dept. of Geological Sci., Univ. of Southern California, Los Angeles, CA, USA).
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.77-92 (July 1983).
The Northwest Syntaxis delineates a complex zone where the Himalayan Ranges meet the Hindu Kush and Indus Kohistan Ranges. Chronologic, stratigraphic, structural, and geophysical data from the syntaxial zone permit the construction of a model for intermontane-basin development and the evolution of the Northwest Syntaxis during the Late Cenozoic. The formation of the Kashmir and Peshawar Basins results from the transfer of thrusting and uplift to the southern margins of the basins. During the Pliocene, the morphotectonic emergence of the ancestral Pir Panjal and Attock Ranges coincides with changes in the patterns of sedimentation and deformation. (43 refs.)

104354 Mossbauer spectroscopic analysis of iron in soils and rocks in the eastern Himalayan foothill region. S.C.Das, S.K.Sengupta, N.C.Paul, N.Bhattacharya, J.B.Basu, N.Chaudhuri (Dept. of Phys., North Bengal Univ., Darjeeling, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.376-8 (June 1983).
As a part of the study of iron-bearing minerals in the eastern Himalayan foothills, the ferrous-ferric ratio for a number of weathered samples in agricultural and forest-covered lands in the altitude range 100-2700 m has been estimated by the Mossbauer method. The results have been compared with similar such results for other countries with a view to indicating the trend of behaviour of iron in bulk and separated samples. The importance of these results in the field of geology and agriculture has been pointed out. (5 refs.)

91.90 OTHER TOPICS IN SOLID EARTH GEOPHYSICS

104355 Ore-controlling space geological objects. V.N.Brukhanov (All-Union Res. Inst. of Geology of Foreign Countries ('Zarubezhgeologia'),,Moscow. Min. of Geology,USSR), A.L.Stavtsev.
Acta Astronaut. (GB), vol.10, no.3, p.153-8 (March 1983).
Geological interpretation of space images plays an important part in recognition of location regularities of mineral deposits. Ore-controlling faults and ring structures have been revealed in the course of space geological investigations. Compilation of space mineragenic and space tectonic maps results in delineation of new ore-bearing and oil- and gas-bearing structures. (8 refs.)

104356 A test of granulometric control of desert dune geometry. R.J.Wasson (Dept. of Biogeography & Geomorphology, Australian Nat. Univ., Canberra, Australia), R.Hyde.
Earth Surf. Processes & Landforms (GB), vol.8, no.4, p.301-12 (July-Aug. 1983).
I.G. Wilson's hypothesis of coarse-tail grain-size control of dune spacing was derived from three dunefields in the Sahara and, although it was supplemented by measurements of spacing from other parts of the world, the grain-size data come only from North Africa. In this paper the hypothesis is tested in the Australian dunefields. Australian dunes do not form separate categories on a P_{20}/s (twentieth percentile/spacing) plot and, when placed on Wilson's diagram, the Australian data form a continuum between dunes and draas. Ripples maintain their identity, suggesting that the average saltation length of sand controls ripple wavelength while dune and Wilson's draas are formed by secondary flow of some kind. In Australia the spread of data on the P_{20}/s diagram indicates that grain-size is not the prime control on s. (14 refs.)

104357 Dune formation on the humid tropical sector of the North Queensland coast, Australia. K.Pye (Dept. of Earth Sci., Univ. of Cambridge, Cambridge, England).
Earth Surf. Processes & Landforms (GB), vol.8, no.4, p.371-81 (July-Aug. 1983).
Several previous attempts have been made to explain the apparent poor development of coastal dunes in the humid tropics in terms of lack of wind energy, failure of sand supply to the shoreline, excessive climatic wetness, salt crust formation on beaches, and the character of tropical back-beach vegetation. However, recent published reports indicate that coastal dune occurrences are more common in the humid tropics than was formerly thought, throwing suspicion on the idea that occurrences are more common in the humid tropics than was formerly thought, throwing suspicion on the idea that environmental conditions militate against dune formation in these areas as a whole. Evidence from the humid tropical sector of the North Queensland coast suggests that the poor development of dunes in this area primarily reflects poor sediment sorting in the beach and nearshore zone and low wind energy at the shoreline due to the nature of the coastal orientation and physiography in relation to the prevailing southeasterly winds. (57 refs.)

104358 Spatial resolution of remotely sensed imagery. A review paper. M.R.B.Forshaw (Blackett Lab., Imperial Coll., Univ. of London, London, England), A.Haskell, P.F.Miller, D.J.Stanley, J.R.G.Townshend.
Int. J. Remote Sens. (GB), vol.4, no.3, p.497-520 (July-Sept. 1983).
An important system-performance parameter for remote-sensing systems of the spatial resolution. This term has an imprecise meaning and there are a multinode of different definitions. The most important definitions are reviewed and consideration is given to the factors which influence the resolution of a given system. It is concluded that no single definition of spatial resolution can be applied to all systems, nor can spatial resolution alone be used to measure the significant information content of image data. (40 refs.)

104359 A composite Landsat image of the United Kingdom. R.H.Merson (Nat. Remote Sensing Centre, Royal Aircraft Establ., Farnborough, England).
Int. J. Remote Sens. (GB), vol.4, no.3, p.521-7 (July-Sept. 1983).
A composite image of the United Kingdom is constructed from 43 Landsat scenes by a wholly digital procedure, using a Prime 750 computer. The scenes are first transformed to National Grid coordinates, using 1200 ground control points, the resampling giving 100 m square pixels. A magnetic tape storage and retrieval system is designed to enable segments of a partially constructed composite image to be transferred to and from a working disk. As each new scene is added, its intensity level in each of four spectral bands are stretched to match the partially constructed image in the area of overlap. (1 ref.)

104360 Point spread functions in imaging a Lambert surface from zenith through a thin scattering layer. J.Otterman (Tel Aviv Univ., Ramat Aviv, Israel), M.Dishon, S.Rehavi.
Int. J. Remote Sens. (GB), vol.4, no.3, p.583-99 (July-Sept. 1983).
Effects of cross radiance, i.e. of reflection from one area and scattering to the zenith over another area (the object pixel) with a different reflectivity, are computed and presented as point-spread functions. The analysis concerns imaging a planar terrain with Lambert law reflectivity, when viewed from the zenith through an optically and geometrically thin horizontal layer of scatterers. The Henyey-Greenstein phase function, with various values of the anisotropy factor is assumed for the scatterers. Based on this analysis, spatial (surface) resolution, when effectively limited by the atmospheric cross radiance, is defined and computed. (8 refs.)

104361 Reflectance models and field measurements: some issues. J.A.Smith (Coll. of Forestry & Natural Resources, Colorado State Univ., Fort Collins, CO, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.131-7 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
Electro-optical field measurements of scene reflectance, together with appropriate target characterization, will play an increasingly important role in the testing, intercomparison, and extension of scene radiation models. Such models, in turn, will serve to extrapolate the range of applicability of field measurements to a wider set of environmental conditions and sensor/source viewing geometries than could practically be obtained by direct measurement. The author presents several issues which must be addressed before such a symbiotic relationship between modeling and measurement approaches can be achieved. The direct comparison of model predictions with field measurements is seen to be a somewhat more subtle task than might be suspected. (17 refs.)

104362 Exhalation of radon and thoron: the question of the effect of thermal gradients in soil. S.D.Schery, A.G.Petschek (New Mexico Inst. of Mining & Technol., Socorro, NM, USA).
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.56-60 (July 1983).
Experimental measurements show no evidence for diurnal variation in exhalation of radon and thoron from soil due to convection induced by thermal gradients in the top few decimeters of soil. Estimates based on convective calculations indicate that even in the unlikely event of either vertical temperature gradients large enough to cause vertical instability, or horizontal gradients sufficient to cause significant convection, any effect would be too small to be detected. (16 refs.)

104363 Generalized least-squares solutions to quasi-linear inverse problems with a priori information. M.Matsu'ura, N.Hirata (Geophys. Inst., Faculty of Sci., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Earth (Japan), vol.30, no.6, p.451-68 (1982).
A quasi-linear inverse problem with a priori information about model parameters is formulated in a stochastic framework by using a singular value decomposition technique for arbitrary rectangular matrices. In many geophysical inverse problems, one has a priori information from which a most plausible solution and the statistics of its probable error can be guessed. Starting from the most plausible solution, the optimization of model parameters is made by the successive iteration of solving a set of standardized linear equations for corrections at each step. A best linear inverse operator which minimizes the variances of estimation errors within the framework of a generalized least-squares approach is directly obtained from the 'natural inverse' of Lanczos (1961) for a coefficient matrix by regarding an eigenvalue in the inverse as zero if it is smaller than unity. This provides a theoretical basis on the 'sharp cutoff approach' of Wiggins (1972) and Jackson (1972, 1979) in their general inverse formalisms. (17 refs.)

104364 Air and soil temperatures during an intense freeze in Shropshire. M.A.Fullen, J.P.Smith (Geography Section, Wolverhampton Polytech., Wolverhampton, England).
Weather (GB), vol.38, no.7, p.205-8 (July 1983).
Soil temperatures during periods of freezing weather are of considerable agricultural and geomorphological importance. Freezing of the uppermost soil influences disaggregation of mineral matter, the development of crumb structure, and the surface water balance in terms of runoff and snow melt. Low soil temperatures play a part in the regulation of soil micro-organisms, seed viability, over-wintering of pathogens and the uptake of nutrients by plants. Protracted periods of low soil temperatures determine the base level from which the soil needs to accumulate warmth for the growing season to come. Continuous measurements of a range of meteorological parameters at Wolverhampton Polytechnic's meteorological station during the severe winter of 1981/82 provided an opportunity to examine the behaviour of soil temperatures beneath snow cover, and during and after snowmelt. The station is located some 10 km west of the West Midland conurbation, near Claverley, east Shropshire (NGR SO 792 943). (no refs.)

104365 A simplified method for calculating the highest wave on deep water. M.A.Srokosz (Inst. of Oceanographic Sci., Wormley, England).
IMA J. Appl. Math. (GB), vol.30, no.2, p.151-9 (March 1983).
Following Longuet-Higgins' (1978) discovery of some new relations between Stokes' coefficients in the theory of gravity waves, it is shown that similar relations may be derived for the coefficients of the highest wave (on deep water) solution of Longuet-Higgins & Fox (1978). These new relations allow the solution to be computed more easily. (9 refs.)

104366 A new low-salinity sea-ice model for UHF radimetry. M.T.Hallikainen (Radio Lab., Helsinki Univ. of Technol., Otaniemi, Finland).
Int. J. Remote Sens. (GB), vol.4, no.3, p.655-81 (July-Sept. 1983).
A first-year sea-ice model, consisting of the dielectric properties and the geometry of ice and snow cover is used for interpreting brightness-temperature measurements of low-salinity sea ice. Dielectric measurements were made on about 400 ice samples, the salinity of which range from 0.1 to 5 per mille by weight and the temperature from −18 to −0.1°C. Measurements were made with the electric field at angles of 0, 30 and 90° to the horizontal in the natural ice field. The effect of the fluctuations in the properties of ice and snow within the radiometer antenna beam are included in the theoretical brightness-temperature model. (30 refs.)

104367 Eigenanalysis of recent United States sea levels. D.G.Aubrey, K.O.Emery (Woods Hole Oceanographic Instn., Woods Hole, MA, USA).
Cont. Shelf Res. (GB), vol.2, no.1, p.21-33 (May 1983).
Spatial and temporal patterns of recent sea-level rises along the United States coastline are examined to ascertain rates of rise, and possible causes for high-frequency fluctuations in sea level. Eigenanalysis identifies several distinct coastal compartments within each of which sea-level behavior is consistent. The United States east coast has three of these compartments: one north of Cape Cod, one between Cape Cod and Cape Hatteras, and the third from Cape Hatteras south to Pensacola. The western gulf coast represents another compartment and the final compartment is along the United States west coast. (21 refs.)

104368 Variability of currents and horizontal eddy coefficients in Eastern Long Island Sound. D.Tolmazin, W.F.Bohlen (Marine Sci. Dept./Inst., Univ. of Connecticut, Groton, CT, USA), M.Fecher.
Cont. Shelf Res. (GB), vol.2, no.1, p.35-48 (May 1983).
Various circulatory mechanisms within the mesoscale range of tidal flows in Eastern Long Island Sound are investigated. Two 13-day time series of current measurements were obtained using three moorings arranged in the form of a triangle. Each mooring contains a single Aanderaa current meter located at a depth of 18 to 20 m. Statistical analysis provides evidence of residual circulation effects of topographic origin in the average flow field. The relative importance and periods of orderly residual patterns and turbulent motions are examined. A computational technique is described to calculate horizontal eddy coefficients in various directions using the mixing length hypothesis. The coefficients developed using this technique are used to investigate various oscillatory mechanisms in the tidal flows. (14 refs.)

104369 An externally forced barotropic circulation model for the New York Bight. T.S.Hopkins, D.A.Dieterle (Dept. of Energy & Environment, Brookhaven Nat. Lab., Upton, NY, USA).
Cont. Shelf Res. (GB), vol.2, no.1, p.49-73 (May 1983).
The sea level and the barotropic, frictional circulation response for the New York Bight are used to demonstrate the effects of external sea-level forcing, bathymetry, and variable friction. The governing equation is the steady, integrated vorticity equation. The boundary conditions are based on the hypothesis that the dynamics of the shelf are driven by the external sea-level gradient and the coastal no-flux condition; and consequently the conditions at the lateral boundaries are dependent thereon. Therefore, the external sea-level slope must be independently specified, and the lateral boundary conditions must be dependently generated. The bottom friction is expressed as related to the sea level through a bottom length parameter and a veer angle. An additional bottom stress component, related to the surface stress, is determined for bottom depths less than the Ekman depth. The model is forced by different wind directions and the results are discussed. (35 refs.)

104370 A shallow core of Mediterranean Water off western Portugal. I.Ambar (Grupo de Oceanographia, Dept. de Fisica, Faculdade de Ciencias, Univ. de Lisboa, Lisboa, Portugal).
Deep-Sea Res. Part A (GB), vol.30, no.6A, p.677-80 (June 1983).
From an analysis of several sets of hydrological data taken in the Gulf of Cadiz area and off the southern half of the western coast of Portugal, it was possible to identify and establish the continuity of a shallow vein of Mediterranean Water, distinct from the already well-established two main cores. Its thermohaline characteristics, in the form of temperature and salinity maxima in the vertical profiles, allowed its identification at density (σ_t) levels between 27.25 and 27.45 with an equilibrium depth between 400 and 700 m and with a thickness of 50 to 100 m. (11 refs.)

104371 Experimental study of the coastal thermocline height variations caused by an impulsively applied wind of limited along-shore extent. D.S.Lee, P.Renouard (Inst. de Mecanique de Grenoble, Grenoble, France).
Dyn. Atmos. & Oceans (Netherlands), vol.7, no.3, p.129-45 (July 1983).
On the large rotating platform of Grenoble's University, a channel ($8\times2\times0.6$ m) has been built, equipped with a wind entrainment simulation effects mechanism. With a local wind, acting over a two-layered ocean, upwelling or downwelling patterns are induced, which are Kelvin-type height variations of the interface; propagating so that, in the northern hemisphere, they leave the coastline to the right of their direction of propagation, and having a profiled exponentially decreasing from the coastline towards the open sea. The agreement between these observations and the recently proposed model of Crepon and Richez (1982) is very good at some distance from the excitation zone. However, this model, for its application, is limited to the situation in which the Ekman layer is of the same order of magnitude as the upper layer. (32 refs.)

104372 A wave height hindcasting procedure tested considering statistical errors of measured waves. P.Aminti (Istituto di Ingegneria Civile, Firenze, Italy), A.Lamberti.
Energ. Elettr. (Italy), vol.60, no.4, p.129-37 (April 1983). In Italian.
Great care is generally needed to perform wave height hindcasting with simplified methods using wind records from a single weather station, usually at one end of the generating area. The results presented are of a comparison between hindcast wave heights and those measured at Termoli over about 3 years. Considering that even direct wave height measurements are not error free, because of the limited length of records, for waves higher than 2 m no evidence was found that disagreement between hindcast and measured values is not to be ascribed to measurement errors. Due to the simplified hypotheses chosen, hindcasting model errors seem on the contrary to prevail for lower waves. (7 refs.)

104373 Concurrent underwater acoustic wave-front fluctuations at two frequencies. H.W.Broek (Bell Labs., Whippany, NJ, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.559-63 (Aug. 1983).
An experiment was performed to determine whether or not a relative phase fluctuation between two receivers of a signal transmitted over a long ocean path can be expressed as the angular frequency times a frequency-independent delay fluctuation. Short pulses were transmitted alternately at 400 and 114 Hz every 15 s from a ship-suspended source at 1000-ft depth to a set of seven bottomed receivers at about 4400-ft depth in a slope northwest of Bermuda. Measurements were made at two ranges: 75 and 145 nmi. Relative delays in arrival at each receiver were measured and the data analyzed. It was concluded that delay fluctuation in units of time is independent of frequency. (13 refs.)

104374 Broadband interference patterns in shallow water. R.T.Bachman, G.T.Kaye (Naval Ocean Systems Center, San Diego, CA, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.576-80 (Aug. 1983).
Variations in received sound pressure level resulting from the multipath interference of broadband noise in shallow water were reconstructed using a simple ray model which ignores sound propagation through the sea floor. The frequency range was from 200-1200 Hz, and source-to-receiver distance varied between 50 and 1000 m. Qualitative agreement between the reconstructed and measured interference patterns was achieved using 12 ray paths at ranges beyond 200 m and at frequencies above 600 Hz. Evidently, a more comprehensive treatment of subbottom sound propagation, not justified by the environmental data currently available, is required for frequencies below 600 Hz. (9 refs.)

104375 The accuracy of the low-degree geopotential: implications for ocean dynamics. C.A.Wagner (NOAA/Nat. Oceanic Service/Nat. Geodetic Survey, Rockville, MD, USA).
J. Geophys. Res. (USA), vol.88, no.B6, p.5083-90 (10 June 1983).
The low-degree portion of a number of recent global gravitational fields have been tested for accuracy using precise accelerations measured on 24-hour satellites. These measurements are independent of the data in the field models. The results show that the most accurate of the recent solutions have degree error variances significantly less than 100 mm (geoid height equivalent) for all degrees less than five. The broad and lasting features of ocean circulation should now be visible when comparing the geoid computed from this model with the average sea surface computed from satellite altimetry. However, before accurate mapping is possible, the equivalent accuracy of the mean altimetric surface at long wavelengths needs to be verified. (31 refs.)

104376 A resonant test-field model of gravity waves. B.J.West (Center for Studies of Nonlinear Dynamics, La Jolla Inst., La Jolla, CA, USA).
J. Fluid Mech. (GB), vol.132, p.417-30 (July 1983).
The author proposes an 'irreversible' resonant test-field (RTF) model to describe the statistical fluctuations of gravity waves on deep water driven by a turbulent wind field. The non-resonant interactions in the gravity-wave Hamiltonian are replaced by a Markov process in the equation of motion for the resonantly interacting gravity waves, i.e. Hamilton's equations are replaced by a Langevin equation for the RTF waves. The RTF models the irreversible energy-transfer process by a Fokker-Planck equation for the phase-space probability density, the exact steady-state solution of which is determined to be non-Gaussian. An H-theorem for the RTF predicts the monotonic approach to the asymptotic steady state near which the transport properties of the field are studied. The steady-state energy-spectral density is calculated (in some approximation) to be k^{-4}. (40 refs.)

104377 Measurement of the statistical characteristics of a turbulent boundary layer in a natural environment [ocean]. V.E.Aerov, A.D.Solodukhin, S.V.Isaev, N.N.Luchko (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1339-43 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.919-24 (Dec. 1982).
Certain characteristics of a turbulent boundary layer are measured in a natural setting by means of an automated measurement system. Deviations of the investigated process from the Gaussian description are inferred on the basis of measurements of the higher statistical moments. (4 refs.)

104378 Wave heights estimated by the Voluntary Observing Fleet compared with instrumental measurements at fixed positions. A.E.Graham (Meteorological Office, Bracknell, England).
Meteorol. Mag. (GB), vol.112, no.1332, p.210-24 (July 1983).
Measured wave heights from twelve locations are compared with visual estimates made by the deck officers of merchant ships adjacent to the site. The methods of measurement and estimation are discussed together with the difficulties encountered in comparing the two different types of wave heights produced and in deriving extremes. (5 refs.)

104379 Wave deformation in the surf zone. K.Iwata, T.Sawaragi (Dept. of Civil Engng., Nagoya Univ., Nagoya, Japan).
Mem. Fac. Eng. Nagoya Univ. (Japan), vol.34, no.2, p.239-83 (Nov. 1982).
An elucidation of mechanics of wave breaking and wave deformation after breaking has been a matter of great interest to coastal engineers as well as researchers in the hydrodynamics field. The authors discuss the wave characteristics at the inception of wave breaking and the wave characteristics at the inception of wave breaking and the wave deformation in the surf zone up to the dry bed from theories and experiments. Both regular and irregular waves are treated. The wave breaking conditions and breaker types wave characteristics such as the wave height, wave profiles, etc., at the breaking point, internal mechanics of breaking waves, changes of wave heights and the mean water levels, and wave run-up heights are described. The main part of the paper discusses the regular wave deformation in the surf zone. (66 refs.)

104380 Theoretical analysis of wave refraction over a step-type sea bottom configuration. N.Marui (Dept. of Civil Engng., Tokyo Metropolitan Univ., Tokyo, Japan).
Mem. Fac. Technol. Tokyo Metrop. Univ. (Japan), no.32, p.3167-76 (1982).
The refraction phenomenon of periodic waves at a step where the water depth suddenly changes in shallow water is theoretically analysed. The refraction coefficient and the reflection coefficient are defined and derived from dynamic laws. Results are also applied to the case of a double step-type bottom and the energy transmitted to the shoreside is evaluated with consideration for the energy reflected to the offshore side. (2 refs.)

104381 An interpretation of synoptic phenomena in the Baltic Sea. A.M.Aitsam, L.A.Talpsepp (Inst. of Thermophys. & Electrophys., Acad. of Sci., Tallin, Estonian SSR).
Oceanology (USA), vol.22, no.3, p.263-6 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
Current velocity and temperature measurements obtained with self-contained buoy stations in the open Baltic Sea are analyzed. The measured dominant 6 to 8-day fluctuations are interpreted as unstable topographic waves. (10 refs.)

104382 Notes on the generation and structure of turbulent eddies in the equatorial countercurrents of the central Pacific. V.D.Pozdynin (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.267-70 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
Measurements at an equatorial study area prove that, with a probability close to unity, no less than one turbulent eddy with $0.08 \leq u_{\max}'^2 \leq 0.90$ cm^2.sec^{-2} can be generated in the 40 to 90-m layer over a distance of 5 to 6 n mi or during 3 to 4 hr. The mean thickness of the turbulent layer does not exceed 10 m and the horizontal length of the eddy is several hundred meters. The turbulence level decrease away from the center of the disturbance is described by the Gaussian curve. The critical value of the Richardson number is estimated to be ≤ 0.1 to 0.15. (5 refs.)

104383 On variability of the fine structure of the temperature field in the seasonal thermocline. L.L.Sukhov (Shirshov Inst. of Oceanography, Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.271-3 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
Data on the measurements of the fine structure of the temperature field in the seasonal thermocline are examined. The profiles of the fine structure, the phase difference, and the coherence K between profiles with different time lags τ are calculated. The behavior of the coherence function suggests that internal waves with an inertial period have no effect on the profiles. (5 refs.)

104384 Statistical properties of whitecaps on a rough sea. V.G.Bondur, E.A.Sharkov (Inst. of Space Res., Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.274-9 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
Statistical analysis of data obtained by aerial photography of the sea surface gave distributions of the areas occupied by specific whitecap formations. The function describing the generation of whitecaps exhibits a wind-velocity threshold of 4 to 5 m.sec^{-1}. The dependence of the average areas covered by whitecaps on the wind velocity is defined for the wind speed range of 2 to 10.5 m.sec^{-1}. (14 refs.)

104385 'Reconstitution' of the spectral light attention coefficients of sea water in the 270 to 590 nm range from measurements at two wavelengths. O.V.Kopelevich (Shirshov Inst. of Oceanography, Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.288-92 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
The spectral values of the light attenuation coefficients of sea water in the range 270-590 nm can be calculated with the help of the system of eigenvectors of their covariance matrix using data from measurements at two wavelengths (390 and 550 nm); the average errors over the spectrum for such a calculation are $\sim$0.01 m^{-1} in the visible and $\sim$0.04 m^{-1} in the ultraviolet ranges. (6 refs.)

104386 Penetration of photosynthetically-active solar radiation into Atlantic Ocean waters. V.A.Rutkovskaya, V.N.Pelevin, V.I.Voytov (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).
Oceanology (USA), vol.22, no.3, p.293-7 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.3 (1982).
The attenuation of photosynthetically-active solar radiation (PAR) in the Atlantic Ocean to the 100-m depth is computed. A map of the optical index m that describes water types and controls PAR attenuation, is plotted. A relationship between the *m* distribution thus obtained and hydrophysical parameters of a given water basin is defined. The method used to evaluate the level of PAR at depth and spectral composition of light down to the 100 m level in different ocean regions is described. The values of *m* and primary production levels are compared. (17 refs.)

104387 The physical oceanography of fjords. D.M.Farmer, H.J.Freeland (Inst. of Ocean Sci., Sidney, BC, Canada).
Prog. Oceanogr. (GB), vol.12, no.2, p.147-220 (1983).
Places some theoretical and observational studies in perspective and indicates some of the problems and opportunities in the study of fjords that make it such a challenging and intriguing aspect of oceanographic research. While no attempt is made to reference inclusively the many descriptive accounts of fjords, when discussing specific processes the authors use examples drawn from their own observations and in particular from Knight Inlet, BC. This choice does not reflect any particular bias and the processes occurring in Knight Inlet are certainly not representative of all fjords, but they do provide ready examples illustrating the mechanisms under discussion. Knight Inlet is a useful example from another point of view in that it has become a testing ground for several different theories of fjord circulation; such comparisons are more easily made using data from a single fjord. (157 refs.)

104388 Influence of Rossby waves on the sound-velocity distribution in the ocean. V.M.Kurtepov (P.P. Shirshov Inst. of Oceanology, Acad. of Sci., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.45-7 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.80-3 (Jan.-Feb. 1983).
A procedure is proposed for taking into account the influence of Rossby waves on the distribution of the sound-velocity field in the ocean. Specific calculations carried out for the northwestern part of the Pacific Ocean show that Rossby waves can alter considerably the structure of the underwater sound channel. (7 refs.)

104389 'Linear' source of explosion waves in the ocean. E.N.Pelinovskii, V.E.Fridman, L.N.Tsodikovich (Inst. of Appl. Phys., Acad. of Sci., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.72 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.121-2 (Jan.-Feb. 1983).
The parameters of underwater acoustic signals generated by explosive sources are calculated in stages. In the first stage, at small distances from the source, empirical expressions are used, taking into account the simultaneous action of nonlinearity, dissipation, and spherical spreading. In the second stage, at large distances from the source, the expressions of linear theory are used, taking into account primarily the real stratification of the ocean along with the absorption and scattering of sound waves by the rough surface and botttom of the ocean. The conditions for 'matching' these solutions and the dimensions of the 'nonlinear' zone have been determined. From the point of view of long-range sound propagation it is useful to introduce an equivalent source determined by the parameters of the explosion, permitting the calculations to be carried out strictly within the scope of linear theory. This procedure is discussed by the authors. (4 refs.)

104390 A simple dynamic stochastic model for major anomalies in surface water temperature in the oceans. S.G.Dobrovol'skii (Water Problems Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.53-8 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.68-75 (1982).
The real outline of the coasts is used in examining the response of a two-dimensional thermodynamic model for the upper layer of the oceans to the excitation of stochastic fluctuations in wind speed and air temperature near the water. Numerical experiments are performed for 120 months of model time, and it is shown that the model spectra correspond to the spectra for the fluctuations in water temperature estimated from observations. The variances of the monthly anomalies in surface temperature agree with observations in the North Atlantic. Contributions to the fluctuations from various components of the heat balance are discussed. (13 refs.)

104391 Topographic waves on the continental slope at high latitudes. P.V.Bogorodskii, A.P.Nagurniy (Arctic & Antarctic Res. Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.82-5 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.105-7 (1982).
A theoretical interpretation is given for the observed current fluctuations on the continental slope off Eastern Greenland. It is shown that there exists a bounded spectrum of stable topographic waves for the reverse wave propagating along the continental slope whose period is dependent on the latitude and on the period of the depths on the slope. At high latitudes, these oscillations may coincide with the half-daily tide, which may result in a special condition of large-scale change in the hydrological patterns in the region of the continental slope. (4 refs.)

104392 The kinetic energy in the oceans. V.N.Stepanov, E.I.Shul'man, K.I.Galerkin (Inst. of Oceanology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.8, p.47-51 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.8, p.62-7 (1982).
Average water velocities have been used in determining kinetic energies in the Atlantic, Indian, and Pacific oceans, as well as in the World Ocean as a whole. Estimates have been made for the surface, intermediate, deep, and bottom waters. (5 refs.)

104393 Nature of the central water in the North Atlantic. A.A.Kutalo (Hydrometeorological Res. Center, USSR).
Sov. Meteorol. & Hydrol. (USA), no.9, p.51-4 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.9, p.69-73 (1982).
A mechanism of formation is presented for the North Atlantic central water without invoking hypotheses on water mixing or turbulent transfer of heat and salts. (7 refs.)

104394 Spatial and time structures of North Atlantic water-temperature anomalies. O.A.Vladimirov (Arctic & Antarctic Res. Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.9, p.55-62 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.9, p.74-82 (1982).
Considers the spatial and time structures of water-temperature anomalies in the North Atlantic. The mean anomaly lifetime is determined along with the mean rate of change and the scales of the anomalies. Particular attention is given to the long-period trend in the variability. Trend calculation techniques are demonstrated. (7 refs.)

104395 Dynamic-stochastic calculations of seasonal geostrophic surface water circulation in the eastern tropical zone of the Indian Ocean. V.A.Sokolov, V.B.Kholmanov (State Oceanographic Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.50-5 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.5, p.64-70 (1982).
Describes methods of calculation of currents and three-dimensional smoothing of density fields by means of which water circulation is determined. The initial data are the area-averaged one-degree squares of the seawater density field, bottom relief, and variances of these quantities. The calculation results are presented in the form of vector charts of summer and winter circulation of the ocean surface waters on which estimates of the accuracy of determining these vectors are indicated. A comparative analysis of the current pattern obtained with the results of earlier investigations is given. (9 refs.)

104396 Investigation of the surface-film temperature from results of marine observations. V.V.Shigaev, S.N.Druzhinin, V.L.Lebedev (Moscow State Univ., Moscow, USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.60-4 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.5, p.75-9 (1982).
The results of temperature sounding of a thin water-air boundary layer obtained during the Comprehensive Eastern Expedition of the Geography Department of Moscow State University in the Sea of Japan in July-August 1980 are analyzed. For the first time for marine conditions empirical relations were obtained for the deviations of the radiation temperature of water caused by the film from the temperature of the subsurface water as a function of the total heat flux and wind speed at a height of 10 m. 92.20 INTERDISCIPLINARY ASPECTS OF OCEANOGRAPHY

104397 Vertical concentration profiles of lead in the Central Pacific at 15°N and 20°S. A.R.Flegal (Moss Landing Marine Labs., Mos Landing, CA, USA), C.C.Patterson.
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.19-32 (July 1983).
Concentrations of lead were measured in a surface transect and at two vertical profile stations (15°N and 20°S) in the Central Pacific. The new transect of surface water concentrations of lead corroborates previous measurements, which decrease from 13 ng/kg at 30°N to 4 ng/kg at 17°S. This transect gradient is shown to overlie a similar geographic gradient of subsurface maximum concentrations of lead in the vertical profile stations. Lead concentrations at each of those locations exhibit maxima at 400 m, decreasing concentrations to 2500 m and approximately concentrations of 0.8-1.1 ng/kg below that depth. This relationship makes it possible to view the anthropogenic perturbations of the marine lead cycle on a global scale. (52 refs.)

104398 Uptake of excess CO_2 by an Outcrop-diffusion model of the ocean. U.Siegenthaler (Phys. Inst., Univ. of Bern, Bern, Switzerland).
J. Geophys. Res. (USA), vol.88, no.C6, p.3599-608 (20 April 1983). (Analysis and Interpretation of Atmospheric CO_2 Data, Bern, Switzerland, 14-18 Sept. 1981).
A carbon cycle model is presented in which direct ventilation of intermediate and deep ocean waters in high latitudes is taken into account. The $1^1/_2$-dimensional ocean model is an extension of a box diffusion including a deep-sea outcrop at the surface. If both are calibrated in a consistent way, the outcrop-diffusion ocean takes up more excess CO_2 than the box-diffusion ocean because the outcropping deep water is essentially virgin as to fossil CO_2. Calibration methods are compared. (36 refs.)

104399 Methyl halides in and over the eastern Pacific (40°N-32°S). H.B.Singh, L.J.Salas, R.E.Stiles (Atmospheric Sci. Center, SRI Internat., Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3684-90 (20 April 1983).
Methyl chloride methyl bromide and methyl iodide measurements in an over the eastern Pacific show mean air concentrations of 633 parts per trillion (ppt), 23 ppt, and 2 ppt, and mean surface seawater concentrations of 11.5 ng/l, 1.2 ng/l and 1.6 ng/l respectively. Long-term ambient measurements at a marine Pacific site (39°N) show an essentially unchanging background with some indication of high concentrations of methyl bromide and methyl iodide during summertime. The oceanic data indicate a mean surface supersaturation of 275%, 250%, and 340%, respectively, for these three methyl halides. Depth profiles show that methyl halides are most abundant in the top mixed layer of the ocean. The exchange of these natural occurring compounds across the air-sea interface was studied. (27 refs.)

104400 Dispersal by randomly varying currents. G.T.Csanady (Woods Hole Oceanographic Instn., Woods Hole, MA, USA).
J. Fluid Mech. (GB), vol.132, p.375-94 (July 1983).
The long-term oceanic dispersal of persistent contaminants is approached as a problem in turbulent diffusion, with tidal, wind-driven, and other variable currents relegated to turbulence. The mean advection velocity in this problem is typically small compared with the RMS fluctuation. Therefore, close to a continuous concentrated source, puffs of contaminant of all ages are present and have significant effects. Old puffs, i.e. those released a long time previously, give rise to a background concentration field. Young puffs affect the local contaminant concentration PDF according to the probability of their presence, quantified by the visitation frequency. (15 refs.)

104401 A two layer model for salinity stratification in the Eastern Irish Sea. F.Ahmad (Dept. of Appl. Phys., Univ. of Karachi, Karachi, Pakistan).
Nucleus (Pakistan), vol.18, no.4, p.21-7 (Oct.-Dec. 1981).
An appreciable amount of salinity stratification was observed at a number of stations in the Eastern Irish Sea during the summers of 1975 and 1976. It is shown that this stratification is mainly due to the spreading of the river water outward from the coast and the importance of excess of rainfall over evaporation is about 2% only. This spreading of the river water from the coast is explained on a two layer model. The river flow deduced from the model agrees quite well with that from the records in 1976 but is twice as large in 1975. (6 refs.)

104402 Oyster (Crassostrea virginica) as indicator of heavy metal pollution in some lagoons of the Gulf of Mexico. I.Rosas, A.Baez, R.Belmont (Dept. de Quimica de la Atmosfera, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Water, Air & Soil Pollut. (Netherlands), vol.20, no.2, p.127-35 (Aug. 1983).
The littoral lagoons of the Gulf of Mexico have been investigated to determine the amount of heavy metal pollution. Some lagoons have been contaminated by liquid wastes mainly originating from sugar refining and petrochemical industries, as well as petroleum exploitation and refining. Since mollusks concentrate trace elements, determination of levels of Cd, Cr, Hg, and Pb in oysters (Crassostrea virginica) were measured in some of these lagoons. The results have shown that the concentrations of these metals in lagoon water were below the recommended levels to protect aquatic life, and it was found that oysters are able to concentrate metals, mainly Cd and Pb above the maximum permissible limits for edible consumption. (30 refs.)

92.40 HYDROLOGY AND GLACIOLOGY

104403 Mathematical simulation of stable and equilibrium river bed profiles and slopes. A.M.Trofimov (Kazan Univ., Kazan, USSR), V.M.Moskovkin.
Earth Surf. Processes & Landforms (GB), vol.8, no.4, p.383-90 (July-Aug. 1983).
Two approaches to the simulation of stable and equilibrium longitudinal profiles and slopes are considered. The first one deals with a solution to the equation of solid matter (sediment) continuity in the equilibrium case and the second approach deals with the application of variational principles. The approaches considered and results obtained can be used in hydroengineering construction for designing stable and equilibrium longitudinal profiles of water streams and slopes. (20 refs.)

104404 Results of investigations of extreme water supply from a snow cover and liquid precipitation in the GDR lowlands. II. H.Matthaus (Forschungsinst. fur Hydrometeorologie, Berlin, Germany).
Z. Meteorol. (Germany), vol.33, no.2, p.96-8 (1983). In German.
For pt.I see ibid., vol.32, no.4, p.241-6 (1982). Extreme 3-day totals of water supply from snow cover and from liquid precipitation have been obtained for the lowlands. In extreme situations the maximum may well exceed 110 mm. (3 refs.)

104405 Methodology and results of the calculation of average annual variations of the equilibrium temperature and of the natural temperature of water surfaces in stagnant-water bodies in the GDR. W.Neubert (Forschungsinst. fur Hydrometeorologie, Berlin, Germany).
Z. Meteorol. (Germany), vol.33, no.2, p.99-110 (1983). In German.
Presents a procedure for the calculation of the long-term average annual variation of the temperature of any type of water surface observed from April up to and including November. The deep Stechlinsee and the shallow Goldberger See are studied. (9 refs.)

104406 Drainage analysis in Taiwan and its tectonic implications. Quocheng Sung (Nat. Central Univ., Chungli, Taiwan).
Bull. Geophys. (Taiwan), no.24, p.41-56 (March 1983).
Previous studies on the lineament analysis of remotely sensed images are reviewed. The author suggests that drainage analysis be more objective to extract structural information. Drainage patterns of the two geothermal areas, namely Lushan and Chinhsui-Tutsang, are studied using orientation statistics. Different patterns are recognized in these areas and interpreted as the consequence of different tectonic histories. (20 refs.)

104407 Snow particle morphology in the seasonal snow cover. S.C.Colbeck (US Army Cold Regions Res. & Engng. Lab., Hanover, NH, USA).
Bull. Am. Meteorol. Soc. (USA), vol.64, no.6, p.602-9 (June 1983).
Snow precipitation degenerates rapidly once it reaches the ground. A wide variety of particle types develop in seasonal snow covers, thus leading to a wide range of snow properties. The most common varieties of particles are shown. The physical processes responsible for the growth and development of these particles are described in general terms, although these processes are not understood as well as the processes of crystal growth in the atmosphere. The heat and mass flows associated with the development of these crystals in the snow cover are complicated because of snow's complex geometry. (14 refs.)

104408 Studies on the rainfall runoff mechanism on hillside. II. T.Mishima, A.Kanamaru.
Bull. Fac. Eng. Hiroshima Univ. (Japan), vol.30, no.2, p.103-7 (Nov. 1982). In Japanese.
The paper presents the results of experimental study on the water runoff characteristics from the surface-layer models of hillside. As the result of investigating many data, the existence of the flow moving under the forces of gravity and capillarity and the excellent effect of capillary saturated part on the water holding capacity which take part in water runoff are confirmed, and it can be considered that the mean coefficient of permeability in the zone is constant—and so Darcy's Law is applicable to the zone—in which the depth of flow is composed of both capillary saturated part and gravitational part. (5 refs.)

104409 An agrometeorological method for estimating the infiltration depth and soaking rain in spring for the North China Plain. Tao Zuwen, Pei Buxiang (Acad. of Meteorological Sci., Nat. Meteorological Bureau, China).
Acta Meteorol. Sin. (China), vol.41, no.1, p.97-105 (Feb. 1983). In Chinese.
Using the concept of infiltration of gravity moisture, a model for estimating infiltration depth is presented, using the rainfall and the soil moisture before rain. An index for estimating the amount of soaking rain is presented. 'Soaking' means enough rainfall for adequate growth of the major crop concerned and an infiltration depth to provide adequate soil moisture. Results of calculations are tested with actual determinations. (8 refs.)

104410 Studies on accumulation-ablation processes and distribution of snow in mountain regions, Hokkaido. T.Yamada (Inst. of Low Temperature Sci., Hokkaido Univ., Sapporo, Japan).
Contrib. Inst. Low Temp. Sci. Ser. A (Japan), no.31, p.1-33 (1982).
Orographic characteristics of solid precipitation and accumulation-ablation process of snow in the mountain regions are studied based on the areal distributions of newly fallen snow and of deposited snow in typical mountain regions in Hokkaido throughout accumulation and ablation seasons for several winters. Some simple general rules are found for the distribution of snowfall and the increase and decrease of deposited snow in mountain slopes. The rules allow one to estimate the snow amount at an arbitrary altitude and time from the data of solid precipitation and temperature at the Piedmont Observatory together with the data of only one snow survey at an altitude. (27 refs.)

104411 Experimental studies of coupled heat and moisture transfer in soils during freezing. M.Fukuda (Inst. of Low Temperature Sci., Hokkaido Univ., Sapporo, Japan).
Contrib. Inst. Low Temp. Sci. Ser. A (Japan), no.31, p.35-91 (1982).
Attempts to verify the mechanism and model of heat and moisture transfer in a soil during freezing. The author conducted verificatory experiments to show moisture flows both in the frozen and the unfrozen layer of a freezing soil and made a mathematical analysis of the model using the computer simulation method. (26 refs.)

104412 Gas exchange in the Pee Dee River based on ^{222}Rn evasion. R.J.Elsinger, W.S.Moore (Geology Dept., Univ. of South Carolina, Columbia, SC, USA).
Geophys. Res. Lett. (USA), vol.10, no.6, p.443-6 (June 1983).
Excess ^{222}Rn concentrations decrease downstream in the fresh water section of the Pee Dee River. Groundwater is the primary source of the excess ^{222}Rn to the river. Using the radon concentration gradients determined during four sampling periods, gas exchange rates based on the stagnant film model are calculated. Stagnant film thicknesses range from 19 μm to 48 μm and mass transfer coefficients range from 2.1 m/d to 4.1 m/d. (14 refs.)

104413 Noble-gas evidence for geothermal activity in a karstic terrain: Rocky Mountains, Canada. E.Mazor (Geo-isotope Group, Weizmann Inst. of Sci., Rehovot, Israel), R.O.Van Everdingen, H.R.Krouse.
Geochim. & Cosmochim. Acta (GB), vol.47, no.6, p.1111-15 (June 1983).
Geothermally heated fluids are identified as a component in warm (up to 54°C) springs in the southern Canadian Rocky Mountains. High concentrations of radiogenic He and atmospheric Ne, Ar, Ke and Xe in the gases at the Fairmont Hot Spring, assign the latter to be a 'drowned' fumarole, fed by geothermal steam. Up to 75% depletions in the atmospheric noble gases in several warm springs indicate contributions of residual geothermal water. (12 refs.)

104414 An axisymmetric model for the charging of a liquid-dominated geothermal reservoir. J.Troncoso, D.R.Kassoy (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1389-401 (Sept. 1983).
Heat and mass transfer processes occurring in a model of an axisymmetric liquid-dominated geothermal reservoir are described. The system is composed of a vertical cylindrical region of fractured rock surrounded by a much larger annular aquifer. Hot liquid water, convected into and up the central cylindrical zone is forced into the neighbouring aquifer. Heat is lost to the cold surface as the liquid flows horizontally (radially) in the aquifer. A combination of boundary layer techniques and numerical methods are used to obtain solutions for velocity, temperature and pressure distributions in the system and for the heat flux emanating from the surface of the cap rock. The deep portion of the axisymmetric aquifer is found to be cooled faster than the equivalent part of a planar model. (28 refs.)

104415 On uranium concentration in water. B.C.Talukdar, P.K.Chowdhary, K.M.Pathak (Gauhati Univ., Gauhati, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.381-2 (June 1983).
Uranium concentration in water collected from several parts of Assam, India are determined in clear and stirred conditions by the fission track method. In the clear condition U-concentrations are found to vary from $(0.08 \pm .002)$ to $(5.32 \pm .02)$ μg/1. It is observed that the U-concentration increases in the stirred condition. The results are compared with the global background. (5 refs.)

104416 Control of spurious oscillations in the salt water intrusion problem. R.S.Wikramaratna (Inst. of Hydrology, Wallingford, England), W.L.Wood.
Int. J. Numer. Methods Eng. (GB), vol.19, no.8, p.1243-51 (Aug. 1983).
Shows that the 'streamline upwinding' proposed by Hughes and Brooks (1979) is particularly simple to implement with the coupled nonlinear equations of the problem of salt water intrusion in a coastal aquifer. Because the mechanical dispersion effect is far larger than the molecular diffusion, the notorious spurious oscillations can be controlled by limiting the ratio of grid size to the streamline mixing length. The method is demonstrated on an example of a typical aquifer by giving the diagnostic variation of concentration and various salt profiles for different values of the key parameter. (13 refs.)

104417 Bedrock fracture parameters from the interpretation of well tides. D.R.Bower (Earth Physics Branch, Dept. of Energy, Mines & Resources, Ottawa, Ontario, Canada).
J. Geophys. Res. (USA), vol.88, no.B6, p.5025-35 (10 June 1983).
Presents a theory to account for the main features of the tidal response of an isolated plane fracture as revealed by the water level in an intersecting open borehole. According to the theory the diurnal and semidiurnal tidal constituents (both amplitude and phase) of water level variations depend on the fracture aperture, the orientation (dip and strike) and the radial extent of the fracture, and the compressibility of the asperites. The theory is applied to water level observations made in six open boreholes located in crystalline rock at a test site at the Chalk River Nuclear Laboratories, Atomic Energy of Canada Limited, in Chalk River, Ontario, Canada. (31 refs.)

104418 Convection in an aquifer above a layer of heated impermeable bedrock. R.McKibbin (Dept. of Theoretical & Appl. Mech., Univ. of Auckland, Auckland, New Zealand).
N.Z. J. Sci. (New Zealand), vol.26, no.1, p.49-64 (1983).
It has been proposed (Donaldson 1962) that a convective geothermal aquifer might overlie a layer of impermeable bedrock which conducts heat from the magmatic source below. Using a perturbation analysis similar to that applied to general materially layered porous media by McKibbin and O'Sullivan (1980, 1981) it is found that the presence of such a layer of bedrock markedly affects the convection patterns and heat flow compared with those which occur when the heat source is in direct contact with the convective system. Results show that the overall temperature difference between the heat source and the top surface required for instability is greater, while the heat flux is reduced for both impermeable and constant pressure upper boundary conditions. (4 refs.)

104419 A runoff model for the influx section of a river. N.P.Chernova (Hydrometeorological Res. Center, USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.59-63 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.76-81 (1982).
A model is considered for the transformation of water flow rates in part of a river on the basis of a Duhamel integral, which includes the transformation of the distributed lateral influx or efflux. Results of numerical experiments are given. (5 refs.)

104420 Numerical simulation of currents in Lake Sevan. M.A.Akopyan, Yu.L.Demin (Inst. of Oceanology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.8, p.52-7 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.8, p.68-74 (1982).
A nonlinear diagnostic model has been used in a series of numerical experiments on the currents in Lake Sevan. The roles of various hydrodynamic factors have been examined. Nonlinear effects are important in the water dynamics. (7 refs.)

104421 Influence of noise on estimation of head and transmissivity in two-dimensional groundwater flow field. T.Ueda, F.Hirano, K.Jinno.
Technol. Rep. Kyushu Univ. (Japan), vol.56, no.2, p.101-10 (March 1983). In Japanese.
The authors discuss the influence of the system noise and measuring noise in the estimation of the spatial distribution of aquifer transmissivity and groundwater head. They apply the Kalman filtering theory to an equation of motion of a two-dimensional groundwater flow and to an autoregressive model that describes the spatial structure of the transmissivity. Through the numerical simulations they obtain that the system noise and measuring noise play important roles in the rapid convergence of the estimates of the head and the transmissivity, and in the mutual relations among the observed, estimated, and true values. (4 refs.)

104422 Computation of sedimentation basin behavior. B.E.Larock (Civil Engng. Dept., Univ. of California, Davis, CA, USA), W.K.C.Chun, D.R.Schamber.
Water Res. (GB), vol.17, no.8, p.861-7 (1983).
Parametric numerical studies were conducted to investigate quantitatively the hydraulic performance of typical sedimentation basins. These studies used a mathematical model of basin hydrodynamics, which consists of a continuity equation, two Reynolds equations a two-equation turbulence closure model and a particle transport equation. The resulting distributions of particle concentration throughout the basin, and the basin particle removal efficiencies were computed as a function of particle fall velocity and the amount of particle deposition on the basin floor. A method for extending the model to an investigation of hindered settling is presented. (23 refs.)

92.60 METEOROLOGY

(see also 43.28 Aeroacoustics and atmospheric sound)

104423 Temporal variations in acid precipitation over New York State—what the 1965-1979 USGS data reveal. R.A.Bilonick (Consolidation Coal Co., Pittsburgh, PA, USA), D.G.Nichols.
Atmos. Environ. (GB), vol.17, no.6, p.1063-72 (1983).
During the period from 1965 to 1979, the USGS collected rainfall samples throughout New York State, pH, sulfate, nitrate and calcium levels were measured, among other species. The statistical nature of the variation of these quantities with time was examined. The results indicate that the long-term mean levels of hydrogen, sulfate, nitrate and calcium ion in the bulk (wet plus dry) precipitation samples were essentially constant. Use of the Box-Jenkins method was appropriate because samples that were collected close together in time were clearly more alike than those far apart, indicating autocorrelation. An analysis that fails to take this dependency into account could lead to incorrect conclusions. (10 refs.)

104424 Acid clouds and precipitation in Eastern Colorado. C.T.Nagamoto, F.Parungo, R.Reinking, R.Pueschel, T.Gerish (Office of Weather Res. & Modification, ERL, NOAA, Boulder, CO, USA).
Atmos. Environ. (GB), vol.17, no.6, p.1073-82 (1983).
Rain and snow samples were collected at the eastern foothills of the Rocky Mountains and analysed for chemical composition. Many precipitation samples had pH values considerably more acidic than the 5.6 value of pure water containing only an equilibrium amount of atmospheric CO_2. Clear and considerable dependencies of the acidity on seasonal synoptic scale weather patterns are demonstrated. Cloud water samples, collected by aircraft over eastern Colorado, also showed low pH values. The acidity of clouds was greatest near the city of Denver. (10 refs.)

104425 A regional scale modelling study of the sulfur oxides with a comparison to ambient and wet deposition monitoring data. L.I.Kleinman (Dept. of Energy & Environment, Brookhaven Nat. Lab., Upton, NY, USA).
Atmos. Environ. (GB), vol.17, no.6, p.1107-21 (1983).
Monthly average SO_2 and SO_4^{2-} concentrations and wet deposition of total sulfur have been calculated from the AIRSOX (Atmospheric Impact of Residual Sulfur Oxides) long-range transport model and compared with monitoring data from the SURE (Sulfate Regional Experiment) air quality and MAP3S (Multistate Atmospheric Power Production Pollution Study) precipitation chemistry networks. Model output has also been used to determine the rate constants, distance scales and budgets describing the behaviour of the sulfur oxides in the eastern US during a summer month. Although the accuracy of these later quantities cannot be directly determined via a comparison with monitoring data, the comparison of monthly average model predictions with observations provides a check on the consistency of the SO_x time and distance scales. (26 refs.)

104426 The nocturnal surface inversion height in the Po Valley. C.Tomasi (Istituto Fisbat, CNR, Bologna, Italy).
Atmos. Environ. (GB), vol.17, no.6, p.1123-9 (1983).
Measurements of nocturnal surface inversion height are obtained from radiosonde data taken from a station in the Po Valley on days characterised by anticyclonic conditions, cloudless skies and calm winds at ground level. These measurements are examined in terms of the evolution models for the nocturnal inversion height, as proposed by Anfossi et al. (1974), Yamada (1979), and Nieuwstadt (1980). The results show that Yamada's model can be reliably used in both urban and rural areas, when the surface temperature rate ranges between around -1.3 and $-0.6°C\ h^{-1}$. Nieuwstadt's model, as defined for no turbulent heat flux, is found to produce realistic evolution patterns of the inversion height, very similar to those observed by Anfossi et al. (1974) in rural areas, provided that values of parameter α ranging between 1.5 and 2.5 are used. (8 refs.)

104427 Past and present sulphur pollution in the southern Pennines. P.Ferguson, J.A.Lee (Dept. of Botany, Univ. of Manchester, Manchester, England).
Atmos. Environ. (GB), vol.17, no.6, p.1131-7 (1983).
The southern Pennines are surrounded by towns which were the early centres of the Industrial Revolution, and so are likely to have been exposed to atmospheric pollution for at least 200 years, a fact which may have been responsible for major changes in the vegetation of southern Pennine blanket bogs. Published concentrations of sulphate and hydrogen ions in rain and sulphur dioxide in air in the region during the last century are reviewed, and are compared with an investigation of these pollutants, together with bisulphite concentrations in precipitation at a site in the southern Pennines and Manchester. The results reveal that concentrations of sulphur pollutants in the region have fallen during the last century, but suggest that the acidity of rainwater may be increasing. (30 refs.)

104428 On baroclinic instability in the case of vanishing viscosity. W.Eckhaus, H.P.Penning, F.V.van der Wel (Math. Inst., Utrecht, Netherlands).
Arch. Mech. (Poland), vol.34, no.3, p.243-52 (1982).
In the two-layer model, describing baroclinic instability, viscosity plays a subtle role. The marginal stability curves for the nonviscous model and the one for the viscous model with viscosity tending to zero, do not coincide. An explanation in terms of polynomials with complex coefficients is given and the growth-rate for decreasing viscosity is calculated. (11 refs.)

104429 Millimeter wavelength groundbased observations of two minor constituents of the atmosphere. J.de La Noe, A.Baudyr, N.Monnanteuil, J.-M.Colmont, P.Dierich (Obs. de Bordeaux, Floirac, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1243-8 (2 May 1983). In French.
A millimeter wave telescope located at the Bordeaux Observatory has been used to carry out observations of the 115 GHz line of mesospheric CO and of the 110 GHz line of stratospheric O_3. Optical thickness and column density of these constituents are reported. For the ozone molecule, laboratory collisional broadening measurements associated with model fitting computations allows derivation of the O_3 vertical density profile from the observations. (13 refs.)

104430 The effects of vertical motions induced by orography and of ground friction upon the development and the movement of baroclinic waves in numerical models of different vertical resolution. U.Damrath, A.Meyer (Zentrale Wetterdienststelle, Potsdam, Germany).
Z. Meteorol. (Germany), vol.33, no.2, p.72-91 (1983). In German.
Orographically induced vertical motions and surface friction are studied in a 2-level model, the model of Bengtsson and a 5-parameter model. Baroclinic unstable waves are expressed in terms of the potential vorticity equation. Differences between the models and possibilities of reducing forecast errors are considered. (34 refs.)

104431 Evaluation of the spectral analysis of hourly air temperature values in Banjul in 1973. N.Michelchen (Inst. fur Meereskunde, Akad. der Wissenschaften, Rostock, Germany).
Z. Meteorol. (Germany), vol.33, no.2, p.92-5 (1983). In German.
The power spectra of hourly air-temperature values in Banjul (Republic of The Gambia) for 1973 reveal mesoscale variations. The seasonal division of time series shows the dominance of periods $T \approx 14$-15 d for the central dry season (January-March) and $T \approx 4$-5 d for the rainy season (July-September). The monthly amplitude maximum and minimum of diurnal and semi-diurnal waves follow the solar altitude with a delay of 1-2 month, which seems to be an effect of land-sea breeze. (7 refs.)

104432 A study of the lateral boundary conditions in a numerical storm model. Ching-Sen Chen, Shi-Ming Lin (Nat. Central Univ., Chungli, Taiwan).
Bull. Geophys. (Taiwan), no.24, p.57-76 (March 1983). In Chinese.
Discusses four different methods dealing with horizontal wind on the lateral boundary in a limited domain by using a two-dimensional numerical storm model. The methods developed by Orlanski (1976), Klemp and Wilhelmson (1978), Chen (1980) and Miller and Thorpe (1981) have been expanded into fourteen schemes. From a storm simulation a modified Chen model is found to give best results. The influence of a fixed initial temperature on the lateral boundary is also discussed. (9 refs.)

104433 Budget equations for the energetics of mean, transient and quasi-stationary motions. Long-Nan Chang (Nat. Central Univ., Chungli, Taiwan).
Bull. Geophys. (Taiwan), no.24, p.77-92 (March 1983). In Chinese.
A set of budget equations governing the energetics of time averaged zonal mean, transient and quasi-stationary motions is derived through the use of a moving average procedure. The system involves three available potential energy equations and three kinetic energy equations representing the energy budget . The system derived provides a simple method for the diagnostic study of atmospheric motion in blocking systems. (7 refs.)

104434 Corrections and additions to verification study of performance of 1976 University of Wisconsin model. R.P.Harnack, W.R.Sammler (Dept. of Meteorology & Phys. Oceanography, Rutgers-The State Univ. of New Jersey, New Brunswick, NJ, USA).
Bull. Am. Meteorol. Soc. (USA), vol.64, no.6, p.611-13 (June 1983).
Revised and complete verification statistics for mainland United States long-range forecasts made for the period 1976-80 by the 1976 version of the University of Wisconsin model are presented. Corrections to earlier published values are given, as well as skill scores obtained using a much more complete set of stations for which forecasts are made. (2 refs.)

104435 Recurrence relations for the truncation error coefficients for the extended Stokes function. M.K.Paul (Earth Phys. Branch, Dept. of Energy, Mines & Resources, Ottawa, Canada).
Bull. Geod. (France), vol.57, no.2, p.152-66 (1983).
Recurrence relations for the truncation error coefficients of the extended Stokes function required in the computation of gravimetric geoidal heights at any elevation above the Earth's surface have been derived. The computation of these coefficients generally involves a small fixed number of terms except at altitudes of 2700 km or more when one of the terms involved has to be computed from an infinite series. To confirm the accuracy of the coefficients a verification formula has been devised which uses a series expansion of a piece-wise continuous function such that it is equal to the extended Stokes function over a given range but vanishes elsewhere. (7 refs.)

104436 Correlation of optical propagation near the sea surface with bulk meteorological measurements. F.Replogle,Jr. (Submarine Electromagnetic Systems Dept., Naval Underwater Systems Center, New London, CT, USA).
Boundary-Layer Meteorol. (Netherlands), vol.25, no.4, p.327-43 (April 1983).
Observations of optical propagation and bulk meteorological measurements were made from a tower located off the entrance to Narragansett Bay, RI. Measurements of air and sea temperatures, wind speed, and dew point are used to derive mean values of C_n^2. Then an optical propagation formulation employing C_n^2 (height) are used to predict mean values of the spreading of a narrow target line at ranges of up to 5 km. Predicted line widths are compared with measured ones. Ratios are formed of C_n^2 values obtained from line-width measurements to corresponding values derived from bulk meteorological measurements under unstable atmospheric conditions. (7 refs.)

104437 Turbulence structure in convective boundary layers and implications for diffusion. S.J.Caughey (Meteorological Office, Belfast, N Ireland), M.Kitchen, J.R.Leighton.
Boundary-Layer Meteorol. (Netherlands), vol.25, no.4, p.345-52 (April 1983).
Probability density distributions of vertical velocity fluctuations from the daytime convective boundary layer and from convection within a nighttime stratocumulus-capped boundary layer are described and contrasted. Some implications for the diffusion of released, neutrally buoyant, material are identified and discussed. (15 refs.)

104438 Wind fluctuations in stable air at the Boulder Tower. Z.Leyi, H.A.Panofsky (Dept. of Meteorology, Pennsylvania State Univ., University Park, PA, USA).
Boundary-Layer Meteorol. (Netherlands), vol.25, no.4, p.353-62 (April 1983).
Spectra and variances of velocity components and pressure in stable air are analyzed at the 300 m tower of the BAO. Spectra in very stable air in light winds usually contain low-frequency fluctuations of large magnitude, and high-frequency fluctuations with considerably less energy, separated by a gap. The wave-length of the gap follows Monin-Obukhov scaling. The high-frequency portion of the spectra has characteristics of turbulence. The low-frequency energy is almost certainly due to gravity waves. Variances of surface pressure changes appear to be positively correlated with variances of vertical velocity above 100 m, and also to some extent, with horizontal velocity components at all levels. (11 refs.)

104439 A barotropic planetary boundary layer. D.Yordanov (Geophys. Inst., Acad. of Sci., Sofia, Bulgaria), D.Syrakov, G.Djolov.
Boundary-Layer Meteorol. (Netherlands), vol.25, no.4, p.363-73 (April 1983).
The temperature and wind profiles in the planetary boundary layer (PBL) are investigated. Assuming stationary and homogeneous conditions, the turbulent state in the PBL is uniquely determined by the external Rossby number and the stratification parameters. A simple two-layer barotropic model is proposed. It consists of a surface and overlying Ekman-type layer. The system of dynamic and heat transfer equations is closed using K theory. Analytical solutions for the wind and temperature profiles in the PBL are obtained. The internal PBL characteristics necessary for the calculation are presented in terms of the external parameters. (15 refs.)

104440 Numerical experiments with a one-dimensional higher order turbulence model: simulation of the Wangara Day 33 case. C.Chen, W.R.Cotton (Dept. of Atmospheric Sci., Colorado State Univ., Fort Collins, CO, USA).
Boundary-Layer Meteorol. (Netherlands), vol.25, no.4, p.375-404 (April 1983).
A one-dimensional stratocumulus model is developed and incorporated into a cloud/mesoscale model to simulate the evolution of the marine stratocumulus-capped mixed layer. The authors describe the formulation of the higher-order turbulence model. The second-order moments of this model are partially diagnosed. In order to close the system, the parameterization for the third-order moments given by Zeman and Lumley (1976) is adopted and is generalized to include total water and cloud water. A new scheme to parameterize the skewness terms is proposed in order to satisfy the enforced realizability. Those skewness terms are used to close the third-order moments. Experiments are carried out to test the turbulence model by using the Wangara Day 33 data, which represents a 'dry' case study. (20 refs.)

104441 Roughness length of sea, sand, and snow. A.C.Chamberlain (AERE, Harwell, England).
Boundary-Layer Meteorol. (Netherlands), vol.25, no.4, p.405-9 (April 1983).
Profiles of wind speed in driving sand and snow show roughness length increasing as the square of the friction velocity, in accordance with Charnock's (1955) relation for the roughness length of the sea. (12 refs.)

104442 The use of average annual rainfall to derive estimates of orographic enhancement of frontal rain over England and Wales for different wind directions. F.F.Hill (Met Office Radar Res. Lab., Royal Signals & Radar Establ., Great Malvern, England).
J. Climatol. (GB), vol.3, no.2, p.113-29 (April-June 1983).
A field of average annual enhancement, defined as the mean rainfall rate at inland sites minus the mean rate over the coast, has been derived for England and Wales. Past cases of frontal rain associated with low-level winds from the SW quadrant were analysed so as to determine the typical distribution and intensity of orographic enhancement. It is shown that these results are sensitive to wind speed and, in particular, direction. (8 refs.)

104443 A probability analysis of precipitation surplus or deficit. H.S.Takhar, D.J.Cook (Simon Engng. Labs., Univ. of Manchester, Manchester, England).
J. Climatol. (GB), vol.3, no.2, p.131-42 (April-June 1983).
The surplus or deficit of precipitation is of fundamental importance in hydrology. An analysis is presented which provides for the prediction of surplus or deficit conditions as far as six months ahead. Data from Yorkshire, together with thirteen years' data from a station in Nottinghamshire, are used statistically to analyse problems in water supply, irrigation and drainage. This analysis is based upon a technique developed by Stol (1958) in which differences between evaporation and precipitation are analysed over different periods of time. (11 refs.)

104444 Extreme distributions of Australian annual rainfall in relation to sea surface temperature. N.A.Streten (Australian Numerical Meteorology Res. Centre, Melbourne, Victoria, Australia).
J. Climatol. (GB), vol.3, no.2, p.143-53 (April-June 1983).
Sea surface temperature (SST) measurements from 1950 to 1969 are analysed for an extensive region of the Southern Hemisphere for six years of very high and very low areal extent of above normal Australian continental rainfall. Years of extensive drought are found to be associated with a predominantly low SST persisting throughout the year over the eastern Indian Ocean and the south-west Pacific in the Australasian region particularly at low latitudes, very wet years over the continent are associated with a persistently warm SST extending from the equator to mid latitudes in the same region. (13 refs.)

104445 Spatial and temporal aspects of the surface wind regime on the Canterbury Plains, New Zealand. I.G.McKendry (Univ. of Canterbury, Christchurch, New Zealand).
J. Climatol. (GB), vol.3, no.2, p.155-66 (April-June 1983).
Seasonal and diurnal patterns produced by the interaction of synoptic scale winds and two thermo-topographic systems, the land/sea breeze and mountain/plain winds, are investigated in a spatial context. Together with gradient winds and the shallow 'lee trough' north-easterlies these local winds create a wind regime composed of several distinctive regional elements, the boundaries

of which are transitional in nature and dependent on time of day and year and the strength of synoptic influences. The sea breeze shows maximum frequency by day in summer in coastal areas whereas katabatic flows are most frequent by night in winter adjacent to the Alps. (22 refs.)

104446 Secular variations of surface temperature and precipitation patterns over the Great Lakes region. W.A.R.Brinkmann (Dept. of Geography, Univ. of Wisconsin, Madison, WI, USA).
J. Climatol. (GB), vol.3, no.2, p.167-77 (April-June 1983).
Spatial patterns of surface temperature and precipitation variability over the Great Lakes region and their changes during the past 78 years are examined using eigenvector analysis. The results show that the region is homogeneous in terms of temperature variations. The most important regional temperature trends have been very similar to the trends in the average annual temperature for the Northern Hemisphere. In the case of precipitation, however, an important boundary divides the region into a north-western and south-eastern portion. (26 refs.)

104447 Estimation of the daily global solar irradiation at Corvallis, Oregon (USA) from the hours of bright sunshine, the daily temperature range and relative humidity. C.R.Nagaraja Rao, W.A.Bradley (Dept. of Atmospheric Sci., Oregon State Univ., Corvallis, OR, USA).
J. Climatol. (GB), vol.3, no.2, p.179-85 (April-June 1983).
Simple empirical relationships based on the hours of bright sunshine, the daily temperature range and relative humidity have been developed to estimate the daily global solar irradiation at Corvallis, Oregon. It is observed that the greater part of the variability in the daily solar radiation income at the surface is explained by changes in the available solar energy at the top of the atmosphere in the course of the year. The relationship based on the hours of bright sunshine yields estimates of the daily global solar irradiation which compare favorably with the measured values (coefficient of determination >0.90). (19 refs.)

104448 The relative importance of the initial variables for numerical rain storm prediction. Chen Shoujun, Xie An, Xiao Wenjun (Dept. of Geophys., Peking Univ., Peking, China).
Acta Meteorol. Sin. (China), vol.41, no.1, p.6-13 (Feb. 1983). In Chinese.
Some experiments were made to determine the relative importance of the meteorological variables in the initial conditions for numerical rain storm prediction. A time integration is made with a 5 L-FLM, using a complete set of realistic initial conditions. This is a 'control run'. Next, the integration is repeated, but one of the initial variables is modified. Both results are compared. If the solutions are found to be essentially the same, it may be concluded that the variable is redundant. Three variables: moisture, boundary wind and surface pressure are tested. (9 refs.)

104449 On the general circulation and barotropic energetics at the 500 mb level during January 1977. Qiu Yong yen, Zhu Ya fen (Dept. of Geophys., Peking Univ., Peking, China).
Acta Meteorol. Sin. (China), vol.41, no.1, p.14-23 (Feb. 1983). In Chinese.
January 1977 was unusually cold throughout the mid-latitude continental region in the Northern Hemisphere. By using 500 mb level daily data for January, the general circulation and barotropic energetics are investigated. The nonlinear wave-zonal and wave-wave exchanges of kinetic energy for January are measured over the latitude belt 17.5°N to 77.5°N. The monthly averaged values of these quantities are compared with the normal ones. (12 refs.)

104450 The persistence and the rhythm of anomalies of monthly mean atmospheric circulation in relation to ocean-atmospheric interactions. Wang Shao wu, Zhao Zong ci, Chen Zhen hua (Dept. of Geophys., Peking Univ., Peking, China).
Acta Meteorol. Sin. (China), vol.41, no.1, p.33-42 (Feb. 1983). In Chinese.
The formation of anomalies of monthly mean atmospheric circulation is examined in relation to the interactions between the atmosphere and the sea-surface temperature. In the current regions, the ocean as a heat source exerts a deep influence on the formation of the anomalies of atmospheric circulation. But in the non-current regions the thermal regimes of the oceans are controlled by the atmospheric circulation. The persistence of anomalies in the atmospheric circulation is investigated. The investigation of natural analogies shows that when the circulation or sea surface temperature anomalies for two months have similar characteristics, then the following months also have some similarity, but the similarity does not decrease monotonously with increasing time interval. (26 refs.)

104451 Structure of the mean circulation and the heat budget in July over Asia. Li Wei liang, Chen Long xun, Jin Zu hui (Inst. of Atmospheric Phys., Acad. Sinica, Beijing, China).
Acta Meteorol. Sin. (China), vol.41, no.1, p.43-55 (Feb. 1983). In Chinese.
The vertical velocity and the heat budget Q/Cp in July are evaluated. The aerological data in China is averaged for 1961-1974. For the calculation of the atmospheric heat source Q/Cp, a diagnostic equation is designed. The results are discussed. (12 refs.)

104452 A random solution of a model for long-range forecasts. Li Tianshang (Song Hua Jian Meteorological Service, China).
Acta Meteorol. Sin. (China), vol.41, no.1, p.56-68 (Feb. 1983). In Chinese.
The earth-atmosphere system is approximately assumed to be one which has a linear-responsive system of random interference to solar radiation. The author obtains a random solution and proves that the long-range state of atmospheric motion is dependent on the influence of innumerable random factors. (5 refs.)

104453 Numerical simulation of rain and seeding processes in warm layer clouds. Hu Zhijin, Yan Caifan (Acad. of Meteorological Sci., Nat. Meteorological Bureau, China), Wang Yu-bin.
Acta Meteorol. Sin. (China), vol.41, no.1, p.79-88 (Feb. 1983). In Chinese.
A one-dimensional time-dependent model of precipitation in warm layer cloud is given. The influence of some factors on the warm rain process and its initiation is tested. The process of rain enhancement by salt-seeding is simulated and discussed. (7 refs.)

104454 A study of the microscopic structure of hailstones. Shi Wenquan (Meteorological Inst. of Xinjiang, China), Wang Angsheng.
Acta Meteorol. Sin. (China), vol.41, no.1, p.89-96 (Feb. 1983). In Chinese.
From polarised light and transmitted light photographs of fifty-one hailstone sections made from samples taken in five hailstorms, in Zhaosu, Xinjiang, three kinds of microscopic structure are found, showing crystals, air bubbles, layers and embryo characteristics. Raindrop and hail spectra are sampled. (10 refs.)

104455 Meteosat measurements of vertical fluxes in thunderstorms. N.R.Ward, R.W.Saunders, G.E.Hunt (Dept. of Phys. & Astron., Univ. Coll. London, London, England).
Int. J. Remote Sens. (GB), vol.4, no.3, p.609-16 (July-Sept. 1983).
Measures the fluxes of mass and latent heat in summer thunderstorms over Europe by using Meteosat images to measure the rates of expansion of the cirrus anvils. These measurements are compared with previous satellite estimates of thunderstorm fluxes in both mid-latitudes and the tropics, and also estimates made using other techniques. Four of the storms had mass fluxes in excess of 10^9 kg s^{-1}, which is large for a mid-latitude thunderstorm and comparable with a large tropical thunderstorm. (15 refs.)

104456 Remote sensing of Arkansas tornadoes on 11 April 1976 from a satellite, a balloon and an inonospheric array. R.J.Hung (Univ. of Alabama, Huntsville, AL, USA), R.E.Smith.
Int. J. Remote Sens. (GB), vol.4, no.3, p.617-30 (July-Sept. 1983).
The Arkansas tornadoes on 11 April 1976 were investigated using regular 30 min interval GOES digital infrared data, rawinsonde observations, Doppler sounder records and radar summaries covering the 3 hour time period immediately preceding the touchdown of the tornadoes. Clouds associated with the tornado are compared to other clouds that are not associated with tornadoes. It appears as if the altitude to which the overshooting cloud top penetrates above the tropopause is the major factor that controls tornado formation. Rawinsonde and radar observations are used to establish the background meteorological conditions. Waves are also discussed. (36 refs.)

104457 Photochemical reactivity of perchloroethylene: a new appraisal. B.Dimitriades, B.W.Gay,Jr., R.R.Arnts, R.L.Seila (US Environmental Protection Agency, Research Triangle Park, NC, USA).
J. Air Pollut. Control Assoc. (USA), vol.33, no.6, p.575-87 (June 1983).
Perchloroethylene (PCE), a solvent used in dry cleaning, has been suspected of contributing significantly to photochemical ozone/oxidant (O_3/O_x) problems in urban atmospheres. Past evidence, however, was neither complete nor consistent. To interpret more conclusively the past evidence, and further understand PCE's role in the O_3/O_x problem, a smog chamber testing program was conducted. The program's objectives were: (a) to explain the mechanism of the PCE reaction in smog chamber atmospheres, and (b) to extrapolate the smog chamber findings regarding PCE reactivity to the real atmosphere. Results showed that in smog chambers, PCE reacts and forms O_3/O_x following what appears to be a Cl instigated photooxidation mechanism rather than the OH initiated mechanism accepted in current smog chemistry. (43 refs.)

104458 Over-reflection and instability. Chang-Kou Tai (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA).
Dyn. Atmos. & Oceans (Netherlands), vol.7, no.3, p.147-65 (July 1983).
Stability problems involving parallel shear flow are considered in the context of wave-reflection problems. It is found that if an unstable solution exists and its growth rate is sufficiently small, the growth rate can be connected to the reflection coefficient through a formula as if the unstable growth were the direct result of repeated over-reflections. If the stability problem under consideration has time symmetry, then for every growing solution there exists a corresponding decaying solution. It is shown that a consistent formula can also be derived for the decaying solution, and the existence of at least one critical layer in the corresponding wave-reflection problem is needed in order to account for both the growing and decaying solutions. As an application of these concepts, the small-scale geostrophic instabilities found by Stone (1970) are identified to be associated with over-reflection of inertia-gravity waves. (18 refs.)

104459 Regimes of validity for balanced models. P.R.Gent, J.C.McWilliams (Nat. Center for Atmospheric Res., Boulder, CO, USA).
Dyn. Atmos. & Oceans (Netherlands), vol.7, no.3, p.167-83 (July 1983).
Scaling analyses are presented which delineate the atmospheric and oceanic regimes of validity for the family of balanced models described in Gent and McWilliams (1983a). The analyses follow and extend the classical work of Charney (1948) and others. The analyses use three non-dimensional parameters which represent the flow scale relative to the Earth's radius, the dominance of turbulent or wave-like processes, and the dominant component of the potential vorticity. For each regime, the models that are accurate both at leading order and through at least one higher order of accuracy in the appropriate small parameter are then identified. In particular, it is found that members of the balance family are the appropriate models of higher-order accuracy over a broad range of parameter regimes. Examples are also given of particular atmospheric and oceanic phenomena which are in the regimes of validity for the different balanced models. (15 refs.)

104460 Some radiation budget and cloud measurements derived from Meteosat 1 data. R.W.Saunders, G.E.Hunt (Dept. of Phys. & Astron., Univ. Coll. London, London, England).
Tellus Ser. B (Sweden), vol.35B, no.3, p.177-88 (July 1983).
Visible and infrared digitally encoded images from Meteosat 1 have been converted into broad band reflected and emitted irradiances in order to derive the radiation budget of the underlying surface/atmosphere. These fluxes were determined once an hour over Western Europe for August 21, 1978, averaged over a 1° lat./long. grid. This has allowed a daily mean to be calculated from the twenty-four observations and a standard deviation, a measure of the diurnal variability of the albedo and emitted irradiance. In addition, cloud amounts at three levels were derived every hour. (25 refs.)

104461 The transport and spatial scale of Asian dust-storm clouds: a case study of the dust-storm event of April 1979. Y.Iwasaka, H.Minoura, K.Nagaya (Water Res. Inst., Nagoya Univ., Nagoya, Japan).
Tellus Ser. B (Sweden), vol.35B, no.3, p.189-96 (July 1983).
A dust storm which originated in the China desert area covered the Japanese Islands on April 14-15, 1979. Simultaneous measurement by lidar and geosynchronous meteorological satellite enable the spatial structure and transport path of the dust storm cloud to be characterized. The lidar measurements indicated that the dust cloud consisted of two distinct layers. The trajectory analysis of air mass suggests that the particulate matter contained in the upper layer is probably transported from the Takla-Makan desert and that in the lower layer from the Gobi desert and the Huang-Ho basin. (18 refs.)

104462 Molecular state of sulfate aerosols in the remote Everest highlands. A.Ono, M.Yamato, M.Yoshida (Water Res. Inst., Nagoya Univ., Nagoya, Japan).
Tellus Ser. B (Sweden), vol.35B, no.3, p.197-205 (July 1983).
For the selective detectoin of the sulfuric acid component in individual submicron atmospheric aerosol particles, a new in situ approach using a vapor-deposited calcium thin film as a reactive aerosol-collecting surface has been tested in field observations carried out in the remote Everest highlands. It would appear that there is a vertical stratification in the acidity of sulfite-containing aerosols in the troposphere. (17 refs.)

104463 pH of rainwater in Coimbra, Portugal: the seasonal variation. J.S.Branco, S.J.Formosinho (Inst. Geofisico, Univ. de Coimbra, Coimbra, Portugal).
Tellus Ser. B (Sweden), vol.35B, no.3, p.237-9 (July 1983).
Daily measurements of pH and electrical conductivity of rainwater at Coimbra, Portugal, in the period between autumn 1978 to autumn 1980 are reported. The average conductivity is 26 $\mu\Omega^{-1}$ cm^{-1} and the average pH is 4.75. Neutral salt contribution to conductivity is significant and is highest in autumn/winter. Correlations between neutral salt conductivity and wind direc-

tion were found. pH values have a large dispersion and more than 30% of the samples had a pH <5.0. A seasonal variation of 1.2 pH units was found for the acidity with the highest average pH in autumn and the lowest in summer. A bimodal pH frequency distribution was found for the winter and spring seasons. (3 refs.)

104464 Evidence of an additive effect for ozone plumes from small cities. K.Sexton (Dept. of Environmental Sci. & Physiology, School of Public Health, Harvard Univ., Boston, MA, USA).
Environ. Sci. & Technol. (USA), vol.17, no.7, p.402-7 (July 1983).
Results of an aerial monitoring examining ozone plumes from small cities (population <200000) are presented. Measurements (e.g. ozone, nitrogen oxides, hydrocarbons) by the instrumented aircraft focused on delineating plume dimensions, composition, and chemistry during the first 6 h of transport. In-plume ozone buildup was noted downwind of some small cities on a routine basis, while only sporadically or not at all for others. Airborne emissions from several small cities were observed to overlap when prevailing winds were from either the north or south. Photochemical ozone was consistently recorded in the combined plume produced by these meteorological conditions. Plume dimensions were on the same order of magnitude as those normally associated with large metropolitan areas. (21 refs.)

104465 Prediction of global solar radiation from bright sunshine hours and other meteorological data. H.P.Garg, S.N.Garg (Centre of Energy Studies, Indian Inst. of Technol., New Delhi, India).
Energy Convers. & Manage. (GB), vol.23, no.2, p.113-18 (1983).
Three existing empirical relations which predict global radiation from bright sunshine hours and meteorological parameters were tried for 14 Indian stations where all relevant data was available. A large amount of error ($\pm50\%$) was found. So a new empirical relation was established between global radiation and meteorological parameters. The new relation predicted the insolation within a $\pm10\%$ error limit in most cases. Global radiation dependence on ambient temperature and relative humidity was introduced through atmospheric water content per unit volume. The relation is given. (6 refs.)

104466 Increasing backscattered light from the stratospheric aerosol layer after Mt. El Chicon eruption laser radar measurement at Nagoya (35°N, 137°E). Y.Iwasaka, S.Hayashida, A.Ono (Water Res. Inst., Nagoya Univ., Nagoya, Japan).
Geophys. Res. Lett. (USA), vol.10, no.6, p.440-2 (June 1983).
The increase of backscattered light from the stratospheric aerosol layer was measured by laser radar at Nagoya during the period from the end of April to early July, 1982. On the basis of much information (e.g. SEAN Bull., 1982), this is certainly due to the volcanic eruptions of Mt. El Chichon (Mexico) in March and April 1982. The effect of the Mt. El Chicon eruption on the stratospheric aerosol layer is longer lasting than that of Mt. St. Helens (Washington, USA) in May of 1980. (16 refs.)

104467 Study of daytime peak frequency and bandwidth of atmospherics as a function of azimuth. V.S.Varaprasad, S.Gopalakrishna, P.Sitaramaswamy (Dept. of Appl. Phys., Andhra Univ., Waltair, India).
Int. J. Electron. (GB), vol.55, no.2, p.265-70 (Aug. 1983).
The variation of spectral peak frequency and bandwidth as a function of source distance of atmospherics received during daytime from different directions is presented. Comparing these values with night-time values, it is noticed that the peak frequency is always higher for atmospherics propagating during daytime than those propagating during nighttime in any direction of propagation, the distance of propagation being the same. The bandwidth of the atmospherics received during the night is higher than that received during the day, for any direction of propagation, the distance of propagation being the same. These results are interpreted on the basis of attenuation rates during day and night. (11 refs.)

104468 The role of seasonal reservoirs in the Mars water cycle. II. Coupled models of the regolith, the polar caps, and atmospheric transport. B.M.Jakosky (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).
Icarus (USA), vol.55, no.1, p.19-39 (July 1983).
For pt.I see ibid., vol.55, no.1, p.1-18 (1983). The behavior of water vapor in the Mars atmosphere requires that there be a seasonally accessible nonatmospheric reservoir of water. Coupled models have been constructed which include exchange of water with the regolith and with the polar caps, and transport through the atmosphere due to its circulation. Comparison of the model results with the vapor observations and with other data regarding the physical nature of the surface allows constraints to be placed on the relative importance of each process. (44 refs.)

104469 The global distribution of atmospheric carbon dioxide. I. Aspects of observations and modeling. G.I.Pearman, P.Hyson, P.J.Fraser (Div. of Atmospheric Phys., CSIRO, Aspendale, Australia).
J. Geophys. Res. (USA), vol.88, no.C6, p.3581-90 (20 April 1983). (Analysis and Interpretation of Atmospheric CO_2 Data, Bern, Switzerland, 14-18 Sept. 1981).
A two-dimensionsal global atmospheric transport model is used to relate estimated air to surface exchanges of CO_2 to spatial and temporal variations of atmospheric concentration of CO_2. This serves to illustrate the gross features of the carbon cycle and the measurement precision required of the burgeoning global observational network if the latter is to contribute useful information to the quantitative description of the cycle. Calculations are based on the atmospheric model coupled to a fixed, or variable depth, oceanic mixed layer. Zonally averaged air-sea fluxes of CO_2 are estimated from a relationship between flux, partial pressure, temperature, and wind stress. The result is a time dependent (pre-industrial to 1980) estimate of the meridional rates of net exchange of CO_2 with the oceans. (37 refs.)

104470 The global distribution of atmospheric carbon dioxide. II. A review of provisional background observations, 1978-1980. P.J.Fraser, G.I.Pearman, P.Hyson (Div. of Atmospheric Phys., CSIRO, Mordialloc, Victoria, Australia).
J. Geophys. Res. (USA), vol.88, no.C6, p.3591-8 (20 April 1983). (Analysis and Interpretation of Atmospheric CO_2 Data, Bern, Switzerland, 14-18 Sept. 1981).
For pt.I see ibid., vol.88, no.C6, p.3581-90 (1983). An attempt is made to bring together provisional data collected throughout the world to construct a global picture of the background atmospheric carbon dioxide concentration distribution. The uncertainties, calibration and sampling difficulties, and measurement needs are discussed, and it is concluded that in general the accuracy of the provisional data of each sampling location is $\sim\pm1$ ppmv. The most recent data available (for 1980) indicate annual average northern hemisphere high latitude CO_2 concentrations 4 to 5 ppmv above those at high latitudes of the southern hemisphere ($\sim$336 ppmv). The greatest uncertainty in the zonal average concentration exists in the latitude band 10-30° N. The seasonality of the concentrations is discussed. (33 refs.)

104471 A deconvolution of the tree ring based $\delta^{13}C$ record. Tsung-Hung Peng (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), W.S.Broecker, H.D.Freyer, S.Trumbore.
J. Geophys. Res. (USA), vol.88, no.C6, p.3609-20 (20 April 1983). (Analysis and Interpretation of Atmospheric CO_2 Data, Bern, Switzerland, 14-18 Sept. 1981).
It is assumed that the tree-ring based $^{13}C/^{12}C$ record constructed by Freyer and Belacy (1983) to be representative of the fossil fuel and forest-soil induced $^{13}C/^{12}C$ change for atmospheric CO_2. Through the use of a modification of the Oeschger et al. ocean model, the authors have computed the contribution of the combustion of coal, oil and natural gas to this observed $^{13}C/^{12}C$ change. A large residual remains when the tree-ring-based record is corrected for the contribution of fossil fuel CO_2. A deconvolution was performed on this residual to determine the time history and magnitude of the forest-soil reservoir changes over the past 150 years. (52 refs.)

104472 Some comments of the exchange of CO_2 across the air-sea interface. D.Lal (Phys. Res. Lab., Amhedabad, India), H.E.Suess.
J. Geophys. Res. (USA), vol.88, no.C6, p.3643-6 (20 April 1983). (Analysis and Interpretation of Atmospheric CO_2 Data, Bern, Switzerland, 14-18 Sept. 1981).
Boundary values are estimated for the long-term rate of exchange of carbon dioxide between the atmosphere and the ocean based on the analyses of the experimentally determined shapes of 'wiggles' in the atmospheric $^{14}C/^{12}C$ ratios, for which accurate tree ring data are available for the past 8 millennia. It is shown that the high frequency wiggles (characteristic period of about 200 years) can be explained as entirely due to temporal variations in the global production rate of ^{14}C arising from solar modulaton of galactic cosmic ray flux provided the mean residence time of carbon dioxide in the atmosphere lies in the range (3-25) years. These calculations are based on a four-box model for the carbon cycle. (26 refs.)

104473 Nonlinear response of Stratospheric ozone column to chlorine injections. R.J.Cicerone, S.Walter (Nat. Center for Atmospheric Res., Boulder, CO, USA), S.C.Liu.
J. Geophys. Res. (USA), vol.88, no.C6, p.3647-61 (20 April 1983).
With a reasonably complete and up-to-date photochemical model of the stratosphere, the authors find that the calculated stratospheric ozone-column response to chlorine injections is highly nonlinear. The model calculation assume that the background inorganic (or odd) chlorine , ClX is due to CH_3Cl and CCl_4. Additional ClX is added to the stratosphere by varying input fluxes of CCl_2F_2 and CCl_3F. The sensitivity, $\Delta O_3/\Delta ClX$, of the stratospheric O_3 column to added ClX is relatively small for $ClX\leq3$ ppb or $\Delta ClX\leq2$ ppb; slight ozone increases with ClX are possible over a limited range of ClX if the formation of chlorine nitrate proceeds rapidly. If stratospheric ClX increases to about 9 ppb due to continued usage of CCl_2F_2, CCl_3F and CH_3CCl_3, the stratospheric O_3 column depletion is calculated to be 6.7-9.0%. (53 refs.)

104474 Correlative nature of ozone and carbon monoxide in the troposphere: implications for the tropospheric ozone budget. J.Fishman (NASA Langley Res. Center, Hampton, VA, USA), W.Seiler.
J. Geophys. Res. (USA), vol.88, no.C6, p.3662-70 (20 April 1983).
The small-scale vertical variability of tropospheric O_3 and CO is examined from a set of simultaneous measurements obtained in July and August 1974, between 55°S and 67°N. From this set of vertical profiles, it is noted that many of the fluctuations are coincident in both species, and a method is presented that quantifies the correlation between the observed O_3 and CO variability. A two-dimensional depiction of the distribution of these O_3-CO correlations shows that there are regions in the troposphere where these trace gases are positively correlated, while at the same time there are preferred locations where these two species are primarily anticorrelated. (42 refs.)

104475 Aqueous oxidation of SO_2 by hydrogen peroxide. S.M.Kunen, A.L.Lazrus, G.L.Kok, B.G.Heikes (Nat. Center for Atmospheric Res., Boulder, CO, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3671-4 (20 April 1983).
The aqueous oxidation of S(IV) by H_2O_2 is one of the principal paths of acid formation in the atmosphere. The authors measured the rate constant of the reaction: $H_2O_2\ (a)+S(IV)(a)\rightarrow H_2SO_4$ at condition and concentrations found in the atmosphere. An analytical technique was used in which excess S(IV) (10^{-6} to 10^{-5}M) was reacted with H_2O_2 ($\sim10^{-7}$M). The decay in H_2O_2 concentration with time was followed by using an H_2O_2 luminol-chemiluminescent instrument. The measurements of the S(IV)-H_2O_2 rate constant were in substantial agreement with previous measurements. A first order dependence in the rate constant with hydrogen ion concentration was noted and at 22°C the results can be represented by $k=(8.03\pm0.18)\times10^7[H^+]dm^3mole^{-1}s^{-1}$ when the pH is between 4.0 and 5.8. (17 refs.)

104476 Selected man-made halogenated chemicals in the air and oceanic environment. H.B.Singh, L.J.Salas, R.E.Stiles (Atmospheric Sci., Center, SRI Internat., Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3675-83 (20 April 1983).
Latitudinal distribution (40°N to 32°S) of a number of synthetic halogenated species show that for unreactive species (i.e. fluorocarbon 12 (F 12), F 11, F 113, F 114, F 13B1, SF_6 and CCl_4) the northern hemispheric (NH) burden is only 5 to 10% higher than the southern hemispheric (SH) value. The mean NH/SH concentration ratios for 1,1,1-trichloroethane; dichloromethane; chloroform; 1,2 dichloroethane; and tetrachloroethane are found. A 'mean hydroxyl radical' concentration of $4\text{-}6\times10^5$ mol cm^{-3} and an average interhemispheric exchange rate of 1.2 years best fit the observational data. Oceanic surface and water measurements in the Eastern Pacific show that F 12, F 11 and F 113 concentrations are in rough equilibrium with air concentrations, carbon tetrachloride is significantly undersaturated ($\sim$25%), and chloroform, dichloromethane, trichloroethane and tetrachloroethane are oversaturated. (37 refs.)

104477 A general circulation model study of atmospheric carbon monoxide. J.P.Pinto (NASA Goddard Space Flight Center, Inst. for Space Studies, New York, NY, USA), Y.L.Yung, D.Rind, G.L.Russsell, J.A.Lerner, J.E.Hansen, S.Hameed.
J. Geophys. Res. (USA), vol.88, no.C6, p.3691-702 (20 April 1983).
The carbon monoxide cycle is studied by incorporating the known and hypothetical sources and sinks in a tracer model that uses the winds generated by a general circulation model. Photochemical production and loss terms, which depend on OH radical concentrations are calculated in an interactive fashion. The computed global distribution and seasonal variations of CO are compared with observations to obtain constraints on the distribution and magnitude of the sources and sinks of CO, and on the tropospheric abundance of OH. The simplest model that accounts for available observations requires a low latitude plant source of about 1.3×10^{15} g yr^{-1}, in addition to sources from incomplete combustion of fossil fuels and oxidation of methane. (52 refs.)

104478 Isotope geochemistry of the Amazon basin: a reconnaissance. A.Longinelli (Inst. di Mineralogia Petrografia e Geochemica, Univ. of Palermo, Palermo, Italy), J.M.Edmond.
J. Geophys. Res. (USA), vol.88, no.C6, p.3703-17 (20 April 1983).
On the transects of the Amazon River made by the Alpha Helix in 1976 and 1977, an extensive suite of samples was collected for isotopic analyses. The water isotopes ($^{18}O/^{16}O$, D/H) were determined in atmospheric water vapour and in river, rain and leaf waters. $^{13}C/^{12}C$ ratios were measured in the dissolved and atmospheric CO_2. Determinations were made of $^{34}S/^{32}S$ and oxygen isotopes in dissolved sulphate. The effect of 'continentality' on the water isotopes is minor reflecting the large scale recycling by evapotranspiration from the huge area of forest within the basin. Variations in the isotopic abundances between 1976 (June-July, dry season) and 1977 (May-June, end of wet season) are consistent with the changes in meteorological conditions. The isotopic composition of the CO_2, both atmospheric and dissolved is dominated by biological effects. (32 refs.)

104479 Unusual behavior in the condensation nuclei concentration at 30 km. J.M.Rosen, D.J.Hofmann (Dept. of Phys. & Astron., Univ. of Wyoming, Laramie, WY, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3725-31 (20 April 1983).
The results obtained with an improved balloon-borne condensation nuclei (CN) counter that is capable of operating to altitudes of at least 30 km are presented. Of major interest is the appearance of a quasiannual variation near 30 km which could be described by a sudden concentration increase of unusually small particles occurring in the winter of spring followed by a 1- to 3-month decay period to background levels. The magnitude of the variation has increased dramatically following the recent generally higher levels of volcanic activity affecting the lower stratosphere. Several potential explanations for the event are considered, but none appear entirely satisfactory or complete. (16 refs.)

104480 The contribution of volcanoes to the global atmospheric sulfur budget. H.Berresheim, W.Jaeschke (Center for Environmental Protection, J.W. Goethe-Univ., Frankfurt/Main, Germany).
J. Geophys. Res. (USA), vol.88, no.C6, p.3732-40 (20 April 1983).
A new assessment of the global volcanic emission rates of H_2S, SO_2 and $SO_4$2- is presented. The assessment is based on the development of a suitable classification of volcanic activity and its application to the authors' measurements and data given in the literature. Using this classification, the volcanic sulfur release is estimated to 1.18×10^7 t S/a total. This estimate must be regarded as a minimum since the data available for major explosive events are very uncertain. On the other hand the frequency of such events is comparatively low. A global volcanic emission of 1.52×10^7 t SO_2/a for the period 1961-79 is estimated. (63 refs.)

104481 A decade of stratospheric sulfate measurements compared with observations of volcanic eruptions. W.A.Sedlacek, E.J.Mroz (Los Alamos Nat. Lab., Los Alamos, NM, USA), A.L.Lazrus, B.W.Gandrud.
J. Geophys. Res. (USA), vol.88, no.C6, p.3741-76 (20 April 1983).
Sulfate aerosol concentrations in the stratosphere have been measured for 11 years (1971-81). Data collected seasonally at altitudes between 13 km and 20 km spanning latitudes from 75°N to 51°S are reported. These data are compared with the reported altitudes of volcanic eruption plumes during the same decade. It is concluded that several unreported volcanic eruptions or eruptions to altitudes higher than reported did occur during the decade. The *e*-fold removal time for sulfate aerosol from the stratosphere following the eruption of Volcan Fuego in 1974 was estimated. The volcanic contribution to the average stratospheric sulfate concentration over the decade was greater than 50%. (36 refs.)

104482 Lidar- and balloon-borne particle counter comparisons following recent volcanic eruptions. R.Hofmann, J.M.Rosen (Dept. of Phys. & Astron., Univ. of Wyoming, Laramie, WY, USA), R.Reiter, H.Jager.
J. Geophys. Res. (USA), vol.88, no.C6, p.3777-82 (20 April 1983).
Ballon-borne particle counter measurements at Laramie, Wyoming (41°N) are used to calculate the expected lidar bakscatter at 0.694 μm wavelength from July 1979 to February 1982, a period which included at least four detectable perturbations of the stratospheric aerosol layer due to volcanic eruptions. These calculations are compared with lidar measurements conducted at Garmisch-Partenkirchen (47.5°N) during the same period. While the agreement is generally good using only the main mode in the particle size distribution (radius $\sim$0.07 μm) during approximately the first 6 months following a major volcanic eruption, a measured secondary mode near 1 μm radius, when included, improves the agreement. (10 refs.)

104483 Measurement of stratospheric aerosol near Sanriku (39°N, 142°E) in Japan on May 31, 1979. A.Matsuzaki, Y.Nakamura, T.Itoh (Inst. of Space & Astron. Sci., Tokyo, Japan).
J. Geophys. Res. (USA), vol.88, no.C6, p.3783-8 (20 April 1983).
The altitiude profile of the scattering extinction of stratospheric aerosols was measured by using the balloon-borne spectrometer with the solar occulation method near Sanriku (39°N, 142°E) in Japan on May 31, 1979. The result confirmed that the altitude profile of the scattering extinction turned out to be close to that of the SAM II measurement near Alaska during July 16-19, 1979. (41 refs.)

104484 Spectroscopic measurements of carbon monoxide in the stratosphere. N.Louisnard (ONERA, Chatillon, France), O.Lado-Bordowsky.
J. Geophys. Res. (USA), vol.88, no.C6, p.3789-97 (20 April 1983).
Results obtained from two experiments concerning the repartition of carbon monoxide in the stratosphere are presented and compared to model predictions. Infrared solar adsorption spectra were recorded during a balloon flight from Aire-sur-Adour, France (about 44°N Latitude), in September 1980. The height profile of the mixing ratio presents a minimum of 8 ± 1 ppb around 22-25 km; it reaches 14 ± 1 ppb at 35 km. A similar experiment was performed in April-May 1980 from an aircraft between 64°N and 62°S. The integrated vertical amount above 11.5 km is deduced. There is an important variation of this amount with a maximum at low latitude and a minimum at high latitude related to the height of the tropopause. (25 refs.)

104485 Stratospheric N_2O, CF_2Cl_2, and $CFCl_3$ composition studies utilizing in situ cryogenic, whole air sampling methods. C.C.Gallagher, C.A.Forsberg, R.V.Pieri (Geophys. Lab., Hanscom Air Force Base, MA, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3798-808 (20 April 1983).
The fluorocarbon and nitrous oxide content of the stratosphere have been studied as a function of altitude, latitude, and time. Whole air samples have been gathered from a balloon platform, primarily through use of a cryogenic sampler. Twenty-two flights were conducted between 1975 and 1980, and gas chromatography was utilized to determine species mixing ratios in the retrieved samples. Results are evaluated in terms of various stratosphere models. (36 refs.)

104486 Evidence for quasi-periodic components in Dobson network total ozone records. P.D.Guthrie (Lab. for Planetary Atmospheres, NASA Goddard Space Flight Center, Greenbelt, MD, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3809-18 (20 April 1983).
Power spectrum analysis has been applied to the total ozone time series at each of a sample of Dobson stations with records of more than 15 years in the interval 1957 to 1981. The distributions of strongly periodic or quasi-periodic signals in these spectral estimates, for three spectral estimators and two levels of confidence, show distinct features. These appear at the previously known or suspected periods of 3.5-4.0 years, 27 months, and 21 months as well as the previously unreported period of 11.5 months. Possible geophysical implications are discussed. (19 refs.)

104487 The distribution and annual cycle of ozone in the upper stratosphere. J.E.Frederick (Lab. for Planetary Atmospheres, NASA/Goddard Space Flight Center, Greenbelt, MD, USA), F.T.Huang, A.R.Douglass, C.A.Reber.
J. Geophys. Res. (USA), vol.88, no.C6, p.3819-28 (20 April 1983).
Study of the global distribution of upper stratospheric ozone derived from backscatter ultraviolet (BUV/SBUV) instruments on the Nimbus 4 and 7 satellites reveals the following characteristics for the period June 1970 through May 1972 plus portions of 1978 and 1979. At pressures less than 5 mbar a local midlatitude maximum in the ozone mixing ratio develops in autumn and persists through the winter season in both hemispheres. However, by a pressure of 10 mbar the seasonal trend has reversed, with midlatitude summer values exceeding those in winter. The largest ozone mixing ratios in a global sense occur at tropical latitudes between pressures of 7 and 9 mbar. (18 refs.)

104488 The delta band dissociation of nitric oxide: a potential mechanism for coupling thermospheric variations to the mesosphere and stratosphere. J.E.Frederick (Lab. for Planetary Atmospheres, NASA Goddard Space Flight Center, Greenbelt, MD, USA), R.B.Abrams, P.J.Crutzen.
J. Geophys. Res. (USA), vol.88, no.C6, p.3829-35 (20 April 1983).
Depletion of solar radiation at discrete wavelengths by nitric oxide has a significant impact on the dissociation rate of this gas in the $\delta(0,0)$ and $\delta(1,0)$ bands. Inclusion of the opacity provided by a typical NO profile reduces the dissociation rate in the upper stratosphere to 50-70% of that predicted when the optical depth calculation omits this contribution. Variations in the thermospheric NO abundance modulate the radiation field at the precise wavelengths absorbed by this molecule in the mesosphere and upper stratosphere. Predicted changes in the dissociation rate arising from a varying thermospheric opacity exceed 8% throughout the mesosphere and reach 15% between 65 km and 95 km. (34 refs.)

104489 The evolution of latitudinal shear in Rossby gravity wave, mean flow interaction. T.J.Dunkerton (Phys. Dynamics, Inc., Bellevue, WA, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3836-42 (20 April 1983).
The effects of latitudinal mean wind shear on the Rossby gravity wave are investigated. It is shown that this wave stabilizes barotropically unstable mean flows near the equator. Easterly curvature expands the wave scale and helps to insure the relevance of this theorem. It is also suggested that latitudinal shear, if incorporated into a Holton-Lindzen type experiment, might act to produce a correct asymmetry in shear zone strength in the two phases of the quasi-biennial oscillation. (21 refs.)

104490 Mid-latitude lidar observations of planetary waves in the middle atmosphere during the winter of 1981-1982. A.Hauchecorne, M.L.Chanin (Service d'Aeronomie, CNRS, Verrieres-Le-Buisson, France).
J. Geophys. Res. (USA), vol.88, no.C6, p.3843-9 (20 April 1983).
A quasi-continuous survey of the stratospheric and mesospheric temperature was performed, between June 1981 and April 1982, using the lidar station of the Observatory of Haute-Provence (44°N, 6°E). During the period of easterly winds in the lower stratosphere (i.e. from June to September), the variability of the temperature is observed to be very low. As long as prevailing winds are westerlies, from October to March, temperature profiles are continuously perturbed by planetary waves, with a maximum of amplitude in January 1982, before the 'strong minor warming' of the winter. Spectral analysis of the data indicates the presence of a well-defined 18-day wave interpreted as a free Rossby wave and the existence of large perturbations with periods of 25 to 40 days which are tentatively explained as a succession of minor upper stratospheric warmings due to the interference of the 18 day traveling Rossby wave and a stationary wave. (11 refs.)

104491 Fine Doppler resolution observations of thin turbulence structures in the tropostratosphere at Millstone Hill. R.H.Wand, P.K.Rastogi (Haystack Obs., MIT, Westford, MA, USA), B.J.Watkins, G.B.Loriot.
J. Geophys. Res. (USA), vol.88, no.C6, p.3851-7 (20 April 1983).
The 440-MHz radar at Millstone Hill (42.6°N, 71.5°W) was employed to examine the detailed evolution of turbulence structures in the tropostratosphere with a very fine Doppler resolution of 0.12 Hz, corresponding to 4 cm s^{-1} radial velocity resolution. The measurement technique involved directing the antenna downwind at a low elevation angle (15° or 20°) and processing the echoes from a range where the background wind shear was high. A wide variety of turbulence structures were evident by virtue of their different Doppler shifts in the presence of a high wind shear. Using arguments based on the dominance of 'shear broadening' and the required velocity gradient to create instabilities, maximum layer thicknesses in the vicinity of 20-300 m were inferred. (20 refs.)

104492 The effects of energetic particle precipitation on the atmospheric electric circuit. J.B.Reagan, R.E.Meyerott, J.E.Evans, W.L.Imhof (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA), R.G.Joiner.
J. Geophys. Res. (USA), vol.88, no.C6, p.3869-78 (20 April 1983).
The solar particle event (SPE) of August 1972 is one of the largest that has occurred in the last 20 years. Since it is so well documented, it can serve as a good example of a major perturbation to the atmospheric electric system. In this paper, ion production rates and conductivities from the ground to 80 km at the peak intensity of the event on August 4 and for 30, 35, and 40 km for the 6-day duration of the event are presented. At the peak of the event, the proton and electron precipitation currents, the ohmic current, and the vertical electric field are calculated inside the polar cap. The particle precipitation currents at this time greatly exceed the normal air Earth current at altitudes above 30 km and produce reversals in the vertical electric field at 28 km and above. (41 refs.)

104493 Acoustic and electric signals from lightning. N.K.Balachandran (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3879-84 (20 April 1983).
Observations of infrasound apparently generated by the collapse of the electrostatic field in the thundercloud, are presented along with electric field measurements and high-frequency thunder signals. The frequency of the infrasound pulse is about 1 Hz and amplitude a few microbars. The observations seem to confirm some of the theoretical predictions of Wilson (1920) and Dessler (1973). The signal is predominated by a compressional phase and

seems to be beamed vertically. Calculation of the parameters of the charged region using the infrasound signal give reasonable values. (5 refs.)

104494 Polarized microwave radiation transfer in precipitating cloudy atmospheres: applications to window frequencies. R.Huang, K.-N.Liou (Dept. of Meteorology, Univ. of Utah, Salt Lake City, UT, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3885-93 (20 April 1983).
A microwave radiation transfer model taking into account Mie scattering polarization effects is developed for a plane-parallel precipitating cloudy atmosphere. In the model the azimuthally averaged Mie scattering phase matrix elements are expressed in terms of double Legendre polynomial expansion and the cloud temperature is approximated by a linear function of the optical depth. The complete solution of the fundamental transfer equation is derived utilizing the discrete-ordinates method for horizontal and vertical polarization components. Using this model, the brightness temperature and degree of polarization for three microwave window frequencies of 19.35, 37.0, and 85.5 GHz are calculated for a number of rainfall rates over both land and ocean surfaces. (17 refs.)

104495 Observations of unusual structures of high-latitude stratospheric electric fields. M.M.Madsen, N.D'Angelo, I.B.Iversen (Danish Space Res. Inst., Lyngby, Denmark).
J. Geophys. Res. (USA), vol.88, no.C6, p.3894-6 (20 April 1983).
Reports the observation, by means of balloon-borne sensors, of three cases of unusual stratospheric electric field structures at high latitudes. In all three cases a region of downward directed electric field is flanked by regions with upward field. In two out of the three cases, the central downward field is much stronger than the average fair weather field. The vertical current densities involved are $<5\times10^{-11}$ A/m^2. These field structures are observed only about 0.5% of the time. (9 refs.)

104496 Stratospheric water vapor. H.W.Ellsaesser (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3897-906 (20 April 1983).
Presents a tutorial review of the understanding of stratospheric H_2O and the processes controlling it. A consistent global picture is synthesised that requires rejection of a minimum of the conflicting observational data. As such, this synthesis is determined somewhat by the personal opinions and beliefs of the author. Paradoxes posed by currently available observational data are noted and ways they might be resolved are suggested. (61 refs.)

104497 Corona point measurements in a thundercloud at Langmuir laboratory. M.E.Weber, M.F.Stewart, A.A.Few (Dept. of Space Phys. & Astron., Rice Univ., Houston, TX, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3907-10 (20 April 1983).
A meteorological radiosonde, modified by the attachment of vertically oriented, pointed, metal rods, and associated instrumentation, was released beneath a thundercloud at Langmuir Laboratory, New Mexico. In addition to information on temperature and winds, the instrument provided an estimate of the vertical component of the cloud electric field by measurement of corona current induced in the rods. Charge volumes were inferred from the sounding. (17 refs.)

104498 Deductions concerning accumulations of electrified particles in thunderclouds based on electric field changes associated with lightning. B.Vonnegut (Atmospheric Sci. Res. Center, State Univ. of New York, Albany, NY, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3911-12 (20 April 1983).
The relationships between the space charge in thunderclouds and the lightning that it causes are so complex or so poorly understood that deductions concerning the nature or location of this charge based solely on observations of lightning are open to question. (5 refs.)

104499 Resuspension of volcanic ash from Mount St. Helens. P.V.Hobbs, D.A.Hegg, L.F.Radke (Atmospheric Sci. Dept., Univ. of Washington, Seattle, WA, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3919-21 (20 April 1983).
Measurements are presented of the size spectra of ash particles, previously deposited on the ground from the May 18, 1980 eruption of Mount St. Helens, that were resuspended into the air in eastern Washington. It is concluded that winds of just a few meters per second were capable of resuspending most of the smaller ash particles and that this caused dramatic reduction in visibility. (5 refs.)

104500 Comparison of the extended boundary condition method and perturbation method for scattering from a sinusoidal sea surface. R.H.Ott, D.J.Fang (Propagation Studies Dept., COMSAT Labs., Clarksburg, MD, USA).
J. Math. Phys. (USA), vol.24, no.8, p.2240-9 (Aug. 1983).
Scattering from a lossy sinusoidal surface is examined by using two methods: extended boundary condition (EBC) and perturbation. The range of applicability of the perturbation approach is established by comparison with EBC. The range of applicability of EBC is established through numerical examples. A convergence criterion based on the sequence of partial sums of the scattered energy is suggested for the application of EBC to lossy surface. New analytical expressions for the perturbation solutions are given. (11 refs.)

104501 Accelerated precipitation of water fogs due to acoustic action of a CO_2 laser pulse. N.N.Belov, K.A.Davydov, N.P.Datskevich, N.V.Karlov, V.V.Konov, G.P.Kuz'min, A.E.Negin, A.A.Nesterenko, A.V.Pakhomov, A.M.Prokhorov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.3, p.167-70 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.139-41 (5 Feb. 1983).
Accelerated precipitation of water fogs, induced by the acoustic action of a pulsed CO_2 laser with energy in the range 0.8-3.2 J/cm^2 and pulse duration $\sim 1\ \mu$s, is observed. (6 refs.)

104502 Measurement of the turbulent dissipation rate and of the vertical exchange coefficient in stable atmospheric layers with a smoke puff technique. D.Guedalia, J.Viguier, A.Druilhet, J.Fontan (Lab. d'Aerologie, Univ. Paul Sabatier, Toulouse, France).
J. Rech. Atmos. (France), vol.17, no.1, p.1-11 (Jan.-March 1983). In French.
Several experiments of diffusion of a puff in stable stratified layers located between 150 and 1500 metres are presented. The vertical diffusion at the early stage gives the dissipation rate ϵ and the exchanges coefficient K_z for a scale of about 10 metres. The variation of K_z and ϵ with the stability of the layer are obtained. (17 refs.)

104503 The influence of a watersurface on the microclimate of the downwind zone. II. Experimental control of local advection models. B.Itier (INRA Station de Bioclimatologie-Teledetection, Versailles, France), D.Cardon, A.Baille, G.Sappe.
J. Rech. Atmos. (France), vol.17, no.1, p.33-44 (Jan.-March 1983). In French.
Following a climatological study around a small lake (Antonioletti et al., 1982), this paper reports the results of the experimental control of predictions by two local advection models of temperature and humidity changes. Horizontal gradients of temperature up to 150 m from the leading edge are measured at four heights (0.5, 1, 2, 3 m) over a flat, dry salt table south-east of a 500 m large water surface. Under strong wind conditions, measurements are in good agreement with the Itier-Perrier model (1976, 1978). Under low wind conditions, and consequently for larger instability, measurements agree better at high level (2-3 m) with Taylor calculations (1970) but remain closer to Itier-Perrier forecasts near the soil surface (0.5, 1 m). Finally, practical rules are given to compute the influence of the water-land temperature difference on the air temperature in the downwind zone, as a function of height, roughness length and distance from the leading edge. (11 refs.)

104504 The recent ^{14}C record in the north-west Mediterranean atmosphere. J.Thommeret, Y.Thommeret (Lab. de Radioactivite Appliquee, Centre Sci. de Monaco, Monaco), M.S.Baxter.
J. Rech. Atmos. (France), vol.17, no.1, p.45-51 (Jan.-March 1983).
A continuous record of atmospheric ^{14}C levels measured in Monaco during the past two decades is presented and analysed. The dominant features reflect input of excess ^{14}C by nuclear weapons tests in the early 1960s followed by exponential decrease of atmospheric ^{14}C levels as the bomb ^{14}C equilibrates within the dynamic carbon cycle. The characteristics of the response to the weapons input are analysed and the halfing-time of atmospheric ^{14}C decrease assessed to be 12 ± 2 years. This figure has wide relevance as a measure of the response time of the carbon cycle to atmospheric perturbations. The concomitant rise in ^{14}C levels in Mediterranean sea water is also illustrated. Predictions of future atmospheric ^{14}C concentrations, including consideration of fossil CO_2 dilution effects, suggest that levels will fall to natural values between 1995 and 2010 AD. (22 refs.)

104505 Variations of rainfall rate and raindrop spectra for stratiform and convective rainshowers. G.Donnadieu (Obs. du Puy de Dome, Univ. de Clermont-Ferrand II, Aubiere, France).
J. Rech. Atmos. (France), vol.17, no.1, p.53-65 (Jan.-March 1983). In French.
During the second and third PEP experiments, it was found that the VIDIAZ spectropluviometer and the Joss-Waldvogel disdrometer were both quite suitable to analyze the time variations of rainfall rate R and parameters N_0 and λ which characterize an exponential raindrop distribution, as well as for rain generated by stratiform clouds (Donnadieu, 1982) as by convective clouds. It is shown that these three parameters are related by the relationship $R=N_0/(6.9\ \lambda^{4.8})$ which is comparable with one established theoretically. Applying the theoretical relationship to these two different rainfall types, it was found that an important increase of R results rather from an increase in N_0 with λ nearly constant for stratiform rain and from a decrease in N_0 and λ for convective rain. A method is described for determining the parameters N_0 and λ by measurements of radar reflectivity and rainfall rate. (9 refs.)

104506 Ice crystal production by cold objects in supercooled clouds. D.Leonard, A.Detwiler (State Univ. of New York, Albany, NY, USA).
J. Rech. Atmos. (France), vol.17, no.1, p.83-88 (Jan.-March 1983).
The number of ice crystals produced by dropping cold metal spheres through supercooled water clouds in a laboratory cold box increases exponentially as sphere temperature decreases from −40°C to −100°C. Over this range of sphere temperatures, ice crystal production increases by at least seven to eight orders of magnitude. Spheres warmer than approximately −40°C did not produce ice crystals in these clouds. Cloud temperature has little influence on ice crystal production for spheres colder than −60°C. For sphere temperatures near and just below −40°C, ice crystal production is predominantly due to the freezing of cloud droplet. For sphere temperatures lower than this, spontaneous homogeneous nucleation from the vapor clearly becomes the predominant process. (10 refs.)

104507 Analyses of moisture and convective activity from cloud, visibility and present weather reports. A.G.Higgins, P.R.W.Wardle (Meteorological Office, Bracknell, England).
Meteorol. Mag. (GB), vol.112, no.1332, p.189-99 (July 1983).
Techniques are developed to obtain analyses of the cloud water mixing ratio of stratiform clouds from cloud, visibility and present weather reports, and to identify and analyse convective activity. The authors describe two techniques and present some examples of the analyses. One application of the work is in the enhancement of initial fields for the mesoscale numerical forecast model. (5 refs.)

104508 Global star radiation measurements on 6 August 1981. A day of midday darkness. R.J.Armstrong (Meteorological Office, Bracknell, England).
Meteorol. Mag. (GB), vol.112, no.1332, p.200-9 (July 1983).
Describes the effect on the solar radiation of the severe storms that hit southern England on 6 August 1981. The feature that distinguished this day from other days of violent thunderstorms, and made front page news, was the darkness that beset many areas, including London, in the middle of the day. From the solar radiation values provided by twelve sites the movement and intensity of the storms across southern and eastern England can be identified. (11 refs.)

104509 Aqueous-phase source of formic acid in clouds. W.L.Chameides, D.D.Davis (School of Geophys. Sci., Georgia Inst. of Technol., Atlanta, GA, USA).
Nature (GB), vol.304, no.5925, p.427-9 (4 Aug. 1983).
In remote regions, formic acid (HCOOH), and to a lesser extent acetic acid (CH_3COOH), have been identified as major acidic components of rain. These two organic acids have also been observed in the gas phase in the southwestern US. The sources of organic acids remain largely unknown. The authors investigated the coupled gas- and aqueous-phase cloud chemistry of HCOOH and report that during the daylight hours aqueous-phase OH radical reactions can both produce and destroy HCOOH in cloud droplets and may, in fact, control the HCOOH levels in rain. Similar mechanisms may also exist for acetic and other organic acids. (26 refs.)

104510 Particle size distributions of *n*-alkanes and ^{210}Pb in aerosols off the coast of Peru. J.K.Schneider, R.B.Gagosian, J.K.Cochran, T.W.Trull (Dept. of Chem., Woods Hole Oceanographic Inst., Woods Hole, MA, USA).
Nature (GB), vol.304, no.5925, p.429-32 (4 Aug. 1983).
Reports as part of the Sea/Air Exchange Program (SEAREX), the particle size distributions of aliphatic hydrocarbons and ^{210}Pb in aerosols over the upwelling zone off the coat of Peru to elucidate the mechanism of transport from continental areas. (28 refs.)

104511 Lidar measurements of the vertical ozone distribution during the June 1981 Intercomparison Campaign GAP/OHP. J.Pelon, G.Megie (CNRS, Verrieres-le-Buisson, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.717-21 (July 1983).
Lidar measurements of the vertical ozone distribution (0-25 km) have been performed on a routine basis from 12 June to 24 June 1981 as part of the International Intercomparison Campaign held at the Observatoire Haute Provence. A brief description of the experimental system is given. Data are presented in terms of vertical ozone profiles and continuous monitoring of the ozone total content in various altitude layers. (7 refs.)

104512 Total atmospheric ozone measured by ground based high resolution infrared spectra—comparison with Dobson measurements. P.Marche, C.Meunier, A.Barbe, P.Jouve (Lab. de Physique Moleculaire, CNRS, Reims, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.723-7 (July 1983).
Total atmospheric ozone has been measured at the 'Observatoire de Haute-Provence', Chiran Station, 1905 m high with a ground based, high resolution IR spectrometer, using the Sun as a source. Results are compared with a Dobson spectrophotometer which has been calibrated and intercompared with a standard. Total ozone values found with Dobson are 4% lower than values given by IR measurements. In addition, a negative correlation between total ozone and tropopause height has been found. (7 refs.)

104513 Tropospheric, stratospheric and mesospheric ozone observed using the Umkehr method. C.Meunier, Ahmed Bekaddour, P.Marche, P.Jouve (Lab. de Phys. Moleculaire, CNRS, Reims, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.729-30 (July 1983).
Ozone vertical profiles have been obtained above the 'Observatoire de Haute-Provence' from 9 to 19 June 1981, with both conventional and short Umkehr methods: the mesospheric and stratospheric ozone variability has been found to be very small while the ozone variability was large in the troposphere and maximum at the tropopause level. (2 refs.)

104514 Atmospheric trace species measured above Haute-Provence Observatory. P.Marche, C.Meunier (Lab. de Phys. Moleculaire, CNRS, Reims, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.731-3 (July 1983).
Trace species have been measured in June 1981, at the 'Observatoire de Haute-Provence' Chiran station, 1905 m high, with a ground based high resolution IR spectrometer using the Sun as a source. Column abundance amounts are given for methane, formaldehyde, hydrogen chloride and hydrogen fluoride. (6 refs.)

104515 Total ozone intercomparison measurements made with a scanning filter photometer. W.A.Matthews (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany).
Planet. & Space Sci. (GB), vol.31, no.7, p.735-6 (July 1983).
A scanning filter photometer using narrow band interference filters for ozone solar absorption studies was installed on Mt Chiran Observatory (1905 m high, 43.9°N, 6.2°E) of the 'Observatoire de Haute-Provence' for the initial part of the intercomparison campaign. The total ozone data obtained agreed to within 2% with the Dobson spectrophotometer at the same site. A sample of the data obtained on one of the intercomparison days is presented. (3 refs.)

104516 Measurements of the vertical distribution of ozone by ground-based microwave techniques at the Bordeaux Observatory during the June 1981 Intercomparison Campaign. J.De La Noe, A.Baudry, M.Perault (Obs. de Bordeaux, Floirac, France), P.Dierich, N.Monnanteuil, J.M.Colmont.
Planet. & Space Sci. (GB), vol.31, no.7, p.737-41 (July 1983).
Spectra of the ozone emission line at 110.832 GHz were obtained by a ground-based technique using radio microwaves at the Bordeaux Observatory, France during the Intercomparison Ozone Campaign on 19 and 26 June 1981. From the spectra, it is possible to obtain altitude profiles of the ozone concentration by a model-fitting computation method which is briefly described. The resulting profiles are given, which can be compared with other observations in the same altitude range. (9 refs.)

104517 Measurement of the vertical ozone distribution by means of an in situ gas phase chemiluminescence ozonometer during the Intercomparison Ozone Campaign, Gap, France, June 1981. P.Aimedieu (CNRS, Verrieres-le-Buisson, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.743-8 (July 1983).
Two vertical ozone profiles have been obtained above Gap (France), with an instrument using a gas phase chemiluminescence technique. Data are given for each 0.5 km. The absolute uncertainty on the measurements increase with altitude from 8% of mixing ratio at 16 km to, at most, 15% at 38 km. Uncertainty analysis leads to an incompressible 6%. The integrated column content between 16 km and flight ceiling is also given. (12 refs.)

104518 GSFC optical ozonesonde results during the Gap, France, intercomparisons, June 1981. A.J.Krueger (NASA/Goddard Space Flight Centre, Greenbelt, MD, USA), P.Simeth, C.A.Fry, K.Tewari.
Planet. & Space Sci. (GB), vol.31, no.7, p.749-59 (July 1983).
A GSFC Super Loki optical ozonesonde instrument was flown as part of the ozone sensor intercomparison balloon campaign at Gap, France, in June 1981. A primary objective was to confirm biases between external absorption techniques, such as the GSFC sonde, and in situ techniques, which include ECC, Mast-Brewer, and DASIBI sondes. The total ozone derived by integrating the optical ozonesonde and ECC profiles is within 2% of the Chiran Dobson Spectrophotometer observation based on a pre-campaign calibration but is 9% greater than the amount derived using a post-campaign calibration. (9 refs.)

104519 NASA-JSC measurements during 'La Campagne d'Intercomparaison d'Ozonometres', GAP, France, June 1981. D.E.Robbins (NASA-Johnson Space Center, Houston, TX, USA).
Planet. & Space Sci. (GB), vol.31, no.7, p.761-5 (July 1983).
Measurements made by the NASA-JSC ozone instrument during the ozone intercomparison campaign from Gap, France during June 1981 are reported. Two flights were made on board the large balloon platform with other instruments using different techniques. The NASA-JSC instrument employs UV absorption photometry to obtain in situ results. Concentration (molecules cm^{-3}) and mixing ratio (pp mV) profiles are given for altitudes from 16 km to float altitudes of 32 and 39 km, respectively for the two flights. A measure of the total column content of ozone was obtained. (1 ref.)

104520 Stratospheric ozone measurements by solar ultraviolet absorption. S.Roeland, C.Lippens, P.C.Simon (Inst. d'Aeronomie Spatiale de Belgique, Bruxelles, Belgique).
Planet. & Space Sci. (GB), vol.31, no.7, p.767-72 (July 1983).
Vertical distributions of ozone in the stratosphere have been determined by means of a UV differential absorption technique using the Sun as a source. The filter radiometer and the data processing are described. Results obtained between altitudes of 22 and 32 km during the Intercomparison Ozone Campaign held in France in June 1981 are presented and discussed. (8 refs.)

104521 Nimbus 7 Total Ozone Mapping Spectrometer (TOMS) data during the GAP, France, ozone intercomparisons of June 1981. A.J.Krueger (NASA/Goddard Space Flight Center, Greenbelt, MD, USA).
Planet. & Space Sci. (GB), vol.31, no.7, p.773-7 (July 1983).
The Nimbus 7 Total Ozone Mapping Spectrometer data over Europe have been specially processed for the 2 days of the ozone sensor intercomparison balloon campaign in June 1981 at Gap, France. The 19 June TOMS map shows an elongated ozone maximum (~400 DU) extending in a NW-SE direction across central Europe and an ozone minimum (300 DU) in the central Atlantic. On 26 June a much smaller ozone maximum (400 DU) is centred in northern France with its main axis running in a SW-NE direction. (4 refs.)

104522 Total ozone measurements derived from TOVS radiances. S.Muller, F.R.Cayla (Etablissement d'Etudes et de Recherches Meteorologiques, Meteorologie Nationale, Boulogne, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.779-85 (July 1983).
A new method of total ozone retrieval from IR satellite data (NOAA6) is presented. It uses ozone transmittance as a predictor of total ozone. Ozone transmittance at 9.6 μm is deduced from radiance at 9.6 μm surface temperature measured at 11 μm, and ozone mean temperature estimated from several channels (among them 9.6 μm) by the radiative transfer equation. A statistical analysis of the retrieved ozone field and a comparison with ground based measurements show that the SE is less than 5% for the considered data set. (10 refs.)

104523 Measurements of total ozone: intercomparison of data from a variety of instruments, June 1981. A.Matthews (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany), P.Marche.
Planet. & Space Sci. (GB), vol.31, no.7, p.787-90 (July 1983).
The total ozone data obtained over southern France from a variety of instruments during the Intercomparison Campaign of June 1981 are presented and intercompared. All the instruments intercompared produced a self-consistent data set in terms of the variations that occurred during the intercomparison period and a discussion of the differences in the absolute values measured is given. (13 refs.)

104524 Measurements of the ozone vertical distribution (0-25 km): comparison of various instruments, Gap—Observatoire de Haute-Provence, June 1981. G.Megie, J.Pelon (CNRS, Verrieres-le-Buisson, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.791-9 (July 1983).
A tentative comparison is made between the various instruments operated at Gap and the Observatoire de Haute-Provence to measure the ozone vertical distribution up to 25 km during the Intercomparison Ozone Campaign. This includes comparison of the three ozonosondes carried on the same payload during the stratospheric open air balloon flights on 19 June and 25/26 June 1981, comparison between Brewer Mast sondes and electrochemical concentration cells on 19 and 26 June. A specific comparison has been made between a ground-based lidar and ECC sondes launched at the same location on 20/21 June 1981. (7 refs.)

104525 Ozone profile intercomparison based on simultaneous observations between 20 and 40 km. P.Aimedieu, A.J.Krueger, D.E.Robbins, P.C.Simon (CNRS, Verrieres-le-Buisson, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.801-7 (July 1983).
The vertical distribution of stratospheric ozone has been simultaneously measured by means of five different instruments carried on the same balloon payload. The launches were performed from Gap during the intercomparison campaign conducted in June 1981 in southern France. Data obtained between altitudes of 20 and 40 km are compared and discussed. Vertical profiles deduced from Electrochemical Concentration Cell sondes launched from the same location by small balloons and from short Umkehr measurements made at Mt. Chiran (France) are also included. Systematic differences of the order of 20% between ozone profiles deduced from solar UV absorption and in situ techniques are found. (11 refs.)

104526 Comparison of ozone vertical distributions measured by different techniques at mesospheric altitudes. N.Monnanteuil, J.De La Noe, P.Marche (Univ. des Sci. et Techniques de Lille, Villeneuve d'Ascq, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.809-10 (July 1983).
The ozone vertical profiles obtained by a microwave technique at the Bordeaux Observatory and by a short Umkehr method at the Chiran station of the Observatoire de Haute-Provence, on 19 June 1981 are compared. There is a good agreement between the results obtained by both methods in spite of the distance between both sites. (4 refs.)

104527 A statewide screening for acid rainfall in Iowa. J.O.Kennedy, A.E.Granston,Jr., R.C.Splinter (Univ. Hygienic Lab., Univ. of Iowa, Iowa City, IA, USA).
Proc. Iowa Acad. Sci. (USA), vol.90, no.2, p.41-3 (June 1983).
From April through October 1980, a statewide screening for acid rainfall was conducted in Iowa. Ninety-seven National Weather Service observers were provided with pH color-indicating strips and measured and recorded the pH of every precipitation sample. Results of the screening indicate pH values of rainfall ranged from a low of 4.0 to a high of 7.0. The pH values 5.7 and 5.9 were observed most often and represented 66% of the 4,197 values measured. Approximately 80% of the rainfall pH values fell in the 5.7 to 7.0 range and 20% in the acid rainfall range (5.6 or less). (5 refs.)

104528 A variability index of wind direction from daily records. F.Valero, E.Hernandez (Catedra de Fisica del Aire, Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain).
Rev. Geofis. (Spain), vol.38, no.2, p.113-19 (1982). In Spanish.
A consistency index of daily direction has been computed by averaging hourly values which were obtained discretising the continuous wind direction records throughout. Such an index has been introduced in order to characterise, with an accuracy higher than that usually employed in wind roses, the direction where winds come from. It has been seen that, when applied to iron aerosol concentrations, it can show effects different from those found without applying a selective criterion for wind direction consistency. (3 refs.)

104529 Climatic anomalies in the tropical Pacific Ocean and corn yields in the United States. P.Handler, E.Handler (Coordinated Sci. Lab., Univ. of Illinois, Urbana, IL, USA).
Science (USA), vol.220, no.4602, p.1155-6 (10 June 1983).
The association between climatic anomalies in the tropical Pacific Ocean, often called El Nino events, and annual corn production in the United States was investigated. Temperature and atmospheric pressure in parts of the United States have been correlated with El Nino events. This research suggests that in years in which an El Nino event causes surface temperatures in the tropical Pacific to become warmer than normal, there is a higher probability of an above-average corn crop in the United States. For years when sea surface temperatures are average or cool, no significant association is observed. (13 refs.)

104530 Sighting of El Chichon sulfur dioxide clouds with the Nimbus 7 total ozone mapping spectrometer. A.J.Krueger (NASA Goddard Space Flight Center, Greenbelt, MD, USA).
Science (USA), vol.220, no.4604, p.1377-9 (24 June 1983).
The eruptions of El Chichon volcano on 28 March and 3 and 4 April 1982 were observed by the Nimbus 7 total ozone mapping spectrometer due to strong absorption by volcanic gases at 312.5 and 317.5 nm. These ultraviolet pictures permit a measurement of the volume, dispersion, and drift of volcanic gas clouds. A preliminary estimate of the mass of sulfur dioxide deposited in the stratosphere by the large eruptions on 3 and 4 April is 3.3×10^{6} tons. (5 refs.)

104531 Solar climates of the United States based on long-term monthly averaged daily insolation values. R.C.Balling,Jr., M.J.Vojtesak (Dept. of Geography, Univ. of Nebraska, Lincoln, NE, USA).
Sol. Energy (USA), vol.31, no.3, p.283-91 (1983).
The paper develops and analyses an objective classification and regionalization scheme of solar climates for the conterminous United States. The use of principal components analysis and Euclidean distance cluster analysis generates 18 solar climatic types based upon long-term mean monthly data. Two of the resultant regions contain 76 per cent of the 221 stations used in this study. The results are shown to vary significantly from the previously published maps of solar climates in the United States. (42 refs.)

104532 Harmonic analysis of monthly insolation levels in the United States. R.C.Balling,Jr. (Dept. of Geography, Univ. of Nebraska, Lincoln, NE, USA).
Sol. Energy (USA), vol.31, no.3, p.293-8 (1983).
The purpose of this paper is to analyze independent temporal variance structures in long-term mean monthly insolation data for the conterminous United States. Harmonic analysis is applied to the annual march of insolation levels at 221 stations, and nearly all variance in the data is explained by one harmonic fit. The statistics from the harmonic analysis display coherent spatial patterns that reveal the extent to which radiation levels are affected by synoptic climatological phenomena. The results suggest a method for accurately interpolating insolation estimates using as few as three parameters. (46 refs.)

104533 Simple models for hourly to daily radiation ratio correlations. T.A.Newell (Dept. of Mech. & Industrial Engng., Univ. of Illinois, Urbana, IL, USA).
Sol. Energy (USA), vol.31, no.3, p.339-42 (1983).
Simple models are derived for expressing hourly to daily ratios of both total and diffuse radiation on a horizontal surface. These models can be useful for use with simplified solar design methods. An important physical condition is the requirement that the ratios integrated over a daylength equal unity. That is, energy must be conserved. The models presented comply with this requirement. Deviation of simplified model results occur in the daily distribution of radiation fractions. The effects of these deviations related to solar system simulation are discussed. (5 refs.)

104534 Perturbations in the two-year rhythm of global atmospheric processes. E.B.Gledzer (Inst. of Atmospheric Phys., USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.10-13 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.16-19 (1982).
The main features of the biennial rhythm in the atmosphere are presented. An interpretation is given of the data on the rhythm in the zonal windspeed in the lower equatorial stratosphere and on the height differences of the 10 mb isobalic surface in two adjacent years (for January in the northern hemisphere) in terms of a cycle with a period of two years and perturbations in the phase of the cycle. The years when perturbations occur are indicated along with the types. (13 refs.)

104535 Estimation of heat transfer between the sea and atmosphere in the intratropical convergence zone. A.A.Sizov (Marine Hydrophys. Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.14-19 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.20-6 (1982).
Data obtained in the tropical Atlantic under the GATE and FGGE programs are used in analyzing the large-scale thermal interaction of the boundary layers of the atmosphere and ocean in the region of ITCZ. It is concluded that there is a considerable flux of heat into the atmosphere at the south margin of the intertrade counter current. The amplitude of the approximately two-month fluctuation in the heat balance at the surface and in the heat content of the upper quasihomogeneous layer of the ocean in the ITCZ region is estimated. (10 refs.)

104536 Estimation of the temperature at the upper boundary of the clouds over the oceans. O.Avaste, O.Kyarner, S.Keevallik (Inst. of Astrophys. & Atmospheric Phys., Acad. of Sci., Estonian SSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.41-5 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.54-9 (1982).
The estimates of Avaste et al. (1981) are used for the amounts of clouds together with climatological mean temperatures for the surface of the ocean and mean monthly fluxes of outgoing radiation. It is assumed that the outgoing flux from the Earth-atmosphere system is proportional to the radiation from a black body with the temperatures of the surface of the oceans and of the upper boundary of the clouds, and corresponding estimates are made of the mean monthly zonal temperatures of the cloud top over the ocean in the belt from 30°N to 30°S. (10 refs.)

104537 The distributions of the total ozone content over the oceans. G.K.Gushchin (Karadag Actinometric Obs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.46-52 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.60-7 (1982).
Observations from ships have given mean distributions of the total ozone TO above the oceans, together with the first data on the seasonal variations in the TO distribution, including differences from the distributions on land. (15 refs.)

104538 Atmospheric perturbations in the region of the intratropical convergence zone during GATE. N.A.Romanova, Yu.A.Romanov (Inst. of Oceanology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.6, p.77-81 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.6, p.99-104 (1982).
GATE data are used in examining the changes in wind and sea-level atmospheric pressure when cyclonic perturbations pass over the east of the tropical zone in the North Atlantic. (12 refs.)

104539 A two-dimensional nonstationary microphysical model for low clouds and advective-radiation fogs. V.I.Khvorost'yanov (Central Aerological Obs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.7, p.10-20 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.7, p.16-28 (1982).
A two-dimensional nonstationary model has been constructed for low clouds and fogs, which includes advective transformation, heat transfer by radiation, heat and water exchange with the underlying surface, and microphysical processes. (20 refs.)

104540 An axially symmetrical numerical model for a tropical cyclone. V.E.Zakharov, Yu.T.Sapronov (Inst. of Experimental Meteorology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.7, p.21-6 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.7, p.29-36 (1982).
The model is based on a second-order Lax-Wendroff difference scheme. This avoids artificial-viscosity effects to a considerable extent and permits experiments on the effects of turbulent viscosity on the evolution of a tropical cyclone. (8 refs.)

104541 Dynamic velocity and tangential stress at the surface of the world ocean. N.Z.Ariel, L.A.Strokina (Principal Geophys. Obs., State Hydrological Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.7, p.45-9 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.7, p.59-64 (1982).
Use is made of the relationship between the resistance coefficient of the sea surface and wind speed with neutral stratification and also of data on the wind speed probability to calculate the dynamic velocity u_* and the tangential stress τ in the bottom layer of air over the Atlantic, Indian, and Pacific Oceans. Maps have been constructed for the distribution of u_* over the oceans of the world for the winter and summer seasons. The map data have been used to determine the mean zonal values of u_* and τ for individual oceans and for the oceans as a whole. (11 refs.)

104542 Microphysical studies on the origin and growth of hail. V.G.Khorguani (High Mountain Geophys. Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.8, p.94-102 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.8, p.118-25 (1982).
Experimental results are presented on the nature of hail nuclei and the role of ice-forming nuclei. It is shown that the hail size distribution is best described by a log-normal curve, while the concentration has an inverse power-law relationship to the size. The trapping coefficient and the thermal conditions for hailstone growth are considered for a supercooled cloud. (28 refs.)

104543 Unusually severe rainstorm in Moscow on 7 July 1981. A.A.Akulinicheva, N.N.Fedorova, I.A.Koroleva (Hydrometeorological Res. Center, USSR).
Sov. Meteorol. & Hydrol. (USA), no.9, p.36-40 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.9, p.49-55 (1982).
The aerosynoptic evidence and data on cloud cover from satellites and meteorological radars have been examined for an unusually severe rainstorm in Moscow. An attempt is made to explain the reasons for the formation of a thick cumulonimbus cloud using actual pluviographic data on the intensity and duration of the rain. An estimate is made of the possible contribution from orographic vertical movements produced by the elevated areas in Moscow for certain wind directions. (5 refs.)

104544 Effect of processes in the surface boundary layer on the formation of large-scale climatic characteristics. V.P.Meleshko, B.E.Shneerov, A.S.Dubov, L.N.Magazenkov (Main Geophys. Obs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.1-11 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.5, p.5-18 (1982).
The sensitivity of a calculated climate to methods of parameterization of a turbulent regime in the surface boundary layer taken into account in a model of the atmosphere is investigated. Numerical experiments are carried out with an atmospheric general circulation model in which two schemes of the boundary layer are used: the semiempirical scheme proposed by Deardorff (1972) and a scheme based on the use of similarity theory hypotheses. The total amount of heat entering the atmosphere from the under-lying surface over continents and oceans is considered. The redistribution of this heat between sensible and latent forms has a substantial effect on the formation of circulation, thermal regime, and water-vapour cycle of the atmosphere. (23 refs.)

104545 Wave motions at low latitudes. M.R.Radzhapov (Tashkent Polytech. Inst., Tashkent, USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.22-30 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.5, p.31-41 (1982).
Three variants of wave solutions of linear equations of dynamics of the atmosphere at low latitudes are examined. The variants differ in the methods of transforming the initial system of equations whose coefficients substantially depend on latitude. It is shown that consideration of the vertical velocity limits the number of wave solutions for long waves to $n=5$. (5 refs.)

104546 Indication of the origin and evolution of radiation fogs by means of lidar. A.E.Tyabotov, A.P.Tikhonov (Central Aerological Obs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.31-5 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.5, p.42-7 (1982).
A method of determining the predictors of the formation and dissipation of radiation fogs by means of lidars is presented and the possibilities of its practical use are evaluated. It is shown experimentally that the ratio of the scattering coefficients at wavelengths 1.06 and 0.53 μm and the degree of polarization of the lidar radiation backscattered by atmospheric aerosol differ from the values of these characteristics observed during formation and dissipation of fog. (6 refs.)

104547 Effect of mixing on the formation of ice nuclei following cloud seeding with dry ice. P.M.Mushenko (Leningrad Hydrometeorological Inst., Leningrad, USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.85-8 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.5, p.103-6 (1982).
Previously the effect of mixing of the evaporation products of CO_2 and air was not taken into account when estimating the number of ice nuclei formed near CO_2 particles. It is shown that the results of calculating the thermodynamic probability of formation of ice nuclei with and without consideration of this effect can differ by several orders of magnitude. Consideration of this circumstance to some extent explains the existing difference between experimental and calculated values of the number of ice particles formed as a result of the effect of dry ice on supercooled clouds and fogs. (7 refs.)

104548 Extreme wind gust speeds in Australia, excluding tropical cyclones. C.M.L.Dorman.
Trans. Inst. Eng. Aust. Civ. Eng. (Australia), vol.CE25, no.2, p.92-106 (May 1983).
A new point of view is derived for Australian wind speeds, in areas not subject to tropical cyclones, which have previously been considered to be properly represented as a N-year wind speed for each station. Attempts to find reduced sampling error by considering daily rather than annual maxima are unsuccessful, and application of the James-Stein estimator, using known sampling error, leads to the conclusion that there is no meaningful difference in extreme wind speeds between one station and another. It is shown that a single Fisher-Tippett Type 1 distribution gives an adequate description of gust speeds for all return periods from 2 days to 2000 years. (16 refs.)

104549 New Zealand—first impressions of a meteorologist and glider pilot. M.P.Garrod (Meteorological Office, Bracknell, England).
Weather (GB), vol.38, no.7, p.194-200 (July 1983).
Discusses the wave and wind formations in the Mt. Cook region of New Zealand from the point of view of a glider pilot and meteorologist. (no refs.)

104550 Circulation type and the spatial distribution of precipitation over central, eastern and southern England. II. J.Stone (West London Inst., London, England).
Weather (GB), vol.38, no.7, p.200-5 (July 1983).
For pt.I see ibid., vol.38, no.6, p.173-7 (1983). In part I, an introduction was given to the study of the relationships between circulation type and spatial distribution of rainfall in central, eastern and southern England, based on data for the period 1961-1975. The distribution for anticyclonic, westerly,

north-westerly, northerly and north-easterly types were covered. In part II the author discusses the rainfall patterns associated with the remaining types, and draws conclusions relating to the whole study. The list of references includes publications referred to in part I. (17 refs.)

104551 New UK 20th century low pressure extreme. S.D.Burt (Meteorological Office, Bracknell, England).
Weather (GB), vol.38, no.7, p.209-13 (July 1983).
During the early hours of the morning of 20 December 1982, the passage of a very intense depression across the north of the British Isles resulted in what would appear to be the lowest atmospheric pressure recorded at any British station since 1886. At 0020 GMT the sea-level pressure at Stornoway in the Hebrides stood at the exceptionally low level of 937.6 mbar, and there is evidence fron the existing pressure gradients to suppose that the pressure on the western side of the Isle of Lewis and at the island of Sule Skerry off Scotland's north coast may have fallen as low as 936 mbar. The synoptic situation is discussed. (1 ref.)

104552 Automobile response to turbulent cross-winds. R.J.Hawks (Tri-State Univ., Angola, IN, USA).
23rd Midwest Symposium on Circuits and Systems, Toledo, OH, USA, 4-5 Aug. 1980 (North Hollywood, CA, USA: Western Periodicals 1980), p.355-9
A linearized three-degree-of-freedom model is used to calculate the power spectral density of the response of an automotive vehicle to a turbulent cross-wind gust. It is found that most of the response occurs at long wavelengths where the turbulent gust energy is small. For some vehicles there may also be significant side-slip and roll responses at wavelengths less than one wheelbase. (9 refs.)

92.60S Climatology

104553 A warm, equable Cretaceous: the nature of the problem. E.J.Barron.
Earth-Sci. Rev. (Netherlands), vol.19, no.4, p.302-38 (Aug. 1983).
The nature of the problem of warm equable paleoclimates is defined by investigating the mid-Cretaceous period. The problem consists of three components: defining precisely the climatic state during any specified interval of geologic time; specifying the external climatic forcing factors which may have been important; and understanding the climatic response to any specific modifying influence. These components are characterized by limitations of critical importance in understanding paleoclimates. The nature of the problem of a warm Cretaceous is defined both qualitatively and quantitatively within these limits. (110 refs.)

104554 An analysis of periodicities in the 1470 to 1974 Beijing precipitation record. S.Hameed, W.M.Yeh (Lab. for Planetary Atmospheres Res., State Univ. of New York, Stony Brook, NY, USA), M.T.Li, R.D.Cess, W.C.Wang.
Geophys. Res. Lett. (USA), vol.10, no.6, p.439-9 (June 1983).
An analysis of a time series consisting of an annual index of dryness/wetness for the years 1470 to 1974 Beijing, China, is presented. Its power spectrum shows that dominant cycles occur with long periods of the order of 80 years. Cycles with periods of 11 and 22 years are weak or non-existent, but a significant signal at 18.7 years (which is also the period of a component of the lunar tide generating force) is detected. The long term variations in Beijing precipitation appear to lag long term (Gleissberg) variations in solar activity by nearly 75 years. A pattern which spans nearly 150 years in the Beijing record is found to be repeated with notable similarity. (16 refs.)

104555 Albedo observations of the Earth's surface for climate research. A.Henderson-Sellers, M.F.Wilson (Dept. of Geography, Univ. of Liverpool, Liverpool, England).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.287-96 (1983).
The primary input of energy to the Earth's climate system occurs at the surface and can be highly sensitive to the surface albedo. It is very difficult to establish an agreed global data set with which to initiate comparative climatic simulations. Albedo observations must be spectrally resolved because reflexion of solar radiation is a strong function of wavelength and incident and reflected beams are modified by the atmosphere. Parametrization of system albedos in energy-balance models draws on satellite data. The establishment of a surface albedo data set generally follows one of two approaches: geographical categorization or remote monitoring. This paper reviews the ways in which remotely derived albedo measurements are used now and may, in the future, be improved for climate research. (67 refs.)

104556 The effects of cloud cover on the energy balance of a climatic system. I.I.Mokhov (Inst. of Atmospheric Phys., USSR).
Sov. Meteorol. & Hydrol. (USA), no.8, p.8-12 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.8, p.134-18 (1982).
Empirical data are used to determine the effects of changes in cloud cover on the radiation balance in the upper boundary of the atmosphere. It is found that for the Northern Hemisphere as a whole any change has little effect on the balance. Various data sources on the cloud cover are compared. (23 refs.)

104557 Changes in global water exchange. R.K.Klige (Inst. of Water Problems, USSR).
Sov. Meteorol. & Hydrol. (USA), no.5, p.12-21 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.5, p.19-30 (1982).
An investigation of long-term changes in individual components of the global water balance showed that they are determined mainly by a change in global thermal conditions at the Earth's surface. As a result of contemporary climatic changes and water-exchange processes gradual drying of the continents and replenishment of the World Ocean are occurring. (31 refs.)

92.65 ATMOSPHERIC OPTICS

(see also 42.00 Optics)

104558 AFGL atmospheric absorption line parameters compilation: 1982 edition. L.S.Rothman (US Air Force Geophys. Lab., Hanscom Air Force Base, MA, USA), R.R.Gamache, A.Barbe, A.Goldman, J.R.Gillis, L.R.Brown, R.A.Toth, J.-M.Flaud, C.Camy-Peyret.
Appl. Opt. (USA), vol.22, no.15, p.2247-56 (1 Aug. 1983).
The latest edition of the AFGL atmospheric absorption line parameters compilation for the seven most active infrared terrestrial absorbers is described. Major modifications to the atlas for this edition include updating of water-vapor parameters from 0 to 4300 cm^{-1}, improvements to line positions for carbon dioxide, substantial modifications to the ozone bands in the middle to

far infrared, and improvements to the 7- and 2.3-μm bands of methane. The atlas now contains ~181000 rotation and vibration-rotation transitions between 0 and 17900 cm^{-1}. The sources of the absorption parameters are summarized. (80 refs.)

104559 Effects of the El Chichon volcanic cloud in the stratosphere on the intensity of light from the sky. K.L.Coulson (Mauna Loa Obs., NOAA ERL, Hilo, HI, USA).
Appl. Opt. (USA), vol.22, no.15, p.2265-71 (1 Aug. 1983).
This is the second of two papers dealing with the effects of volcanic debris from the eruption of El Chichon on light from the sunlit sky. The polarization of skylight was considered in the first of the two, whereas this one is devoted to skylight intensity. It is shown here that the magnitude of the skylight intensity is modifed very significantly from its clear sky value by the volcanic cloud, as is its change with solar depression angle during twilight and its distribution over the sky during the day. Emphasis is on measurements at a wavelength of 0.07 μm. Generally the volcanic cloud produces a diminution of zenith intensity during twilight with a considerable enhancement of intensity over the sky throughout the main part of the day. The solar aureole is not as sharp as it is in normally clear conditions, but the volcanic cloud causes a very diffuse type of aureole which covers a large portion of the sky. The preferential scattering of the longer wavelengths of sunlight, which is made evident by brilliant red and yellow colors in the sunrise period, causes a pronounced change of longwave/shortwave color ratios during twilight from their values in clear atmospheric conditions. The combination of intensity data shown here with polarization data in the previous paper should give a relatively complete picture of the effects of volcanic debris on solar radiation in the atmosphere and be useful in the verification of radiative models of atmospheric turbidity. (24 refs.)

104560 Problems associated with atmospheric visibility measurement techniques. R.W.Johnson, W.S.Hering (Visibility Lab., Univ. of California, San Diego, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.2-8 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
Presents a brief review of the psychophysical relationships which influence an observer's ability to discern barely perceptible changes in apparent contrast with comments related to meteorological observations and instrument calibrations. Examples of how uncertainties in the specification of the atmospheric optical state might influence slant path contrast transmittances are illustrated. (12 refs.)

104561 Influence of atmospheric uncertainties on predicting infrared atmospheric attenuation and radiance. J.E.A.Selby (Res. & Dev. Center, Grumman Aerospace Corp., Bethpage, NY, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.20-5 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
An indication is given of the effect which variations in pressure, temperature, relative humidity, water content, aerosols, and gaseous concentrations have on the attenuation and thermal radiance of the atmosphere in the 2-14 μm region for both horizontal and slant paths. (9 refs.)

104562 Simulation studies and the need for field reflectance studies. M.J.Duggin (Coll. of Environmental Sci. & Forestry, State Univ. of New York, Syracuse, NY, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.150-7 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
There is a need to calibrate satellite data obtained at large polar (i.e. off-nadir) view angles for effects caused by scanner geometry and by the atmosphere. If such effects are not corrected for, then recorded radiance data will contain systematic and random errors which will make accurate target identification and quantification difficult. Adequate calibration of digital radiance data requires both an inductive analysis of digital satellite images and a deductive analysis based upon a priori simulation studies. The inputs to a simulation model (ground reflectance, atmospheric transmission and bandscatter) and their variability are dependent upon (for example) Sun-target-sensor geometry. There is a major need to make accurate ground reflectance measurements to provide calibration information on the anisotropy of ground reflectance. There is also a need to assess atmospheric transmission and backscatter from the image itself. A potential simple, inexpensive method for making ground reflectance measurements in the above context is discussed. (47 refs.)

104563 Atmospheric transmittance derived from radiance measurements. C.M.Randall (Chem. & Phys. Lab., Aerospace Corp., El Segundo, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.60-8 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
Determination of the infrared irradiance caused by stars and other objects outside the Earth's atmosphere by means of sensors located within the atmosphere requires correction for atmospheric effects. Subtraction of the path radiance is often inherent in the sensor design. However, determination of the atmospheric transmittance is more difficult, frequently requiring auxiliary measurements of profiles of species concentration, temperature, and pressure along the optical path. A procedure has been developed for determining the atmospheric transmittance, without reference to atmospheric profiles, from the measured path radiance augmented by surface meteorological observations. The dependence of the effective atmospheric radiating temperature on elevation angle for a given sensor band can be described by a function of elevation angle in which the parameters are determined from surface observations. When the effective radiating temperature of the atmosphere is known, the transmittance is obtained from the emissivity defined by the ratio of the observed path radiance to the Planck function for the effective atmospheric temperature. This algorithm, which is useful only for clear conditions in the infrared spectral windows, has reproduced, in test situations, the transmittance computed with models such as LOWTRAN to within 10% for all portions of the sky with elevation angles greater than 10 deg. (26 refs.)

104564 Telluric spectra from 4690 to 5525 Å in a humid atmosphere. A.Rajaratnam, K.T.Lua (Dept. of Phys., Nat. Univ. of Singapore, Kent Ridge, Singapore).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.999-11 (Aug. 1983).
Solar spectra in the region 4690 to 5525 Å have been taken with a 4.5-m high-resolution grating spectrograph for different solar zenith angles. Three-hundred and eighty-five telluric lines were measured, and their wavelengths, half-intensity widths, equivalent widths, and identifications are reported. (12 refs.)

104565 Variation of atmospheric optical depth for remote sensing radiance calculations. S.Aranuvachapun (Dept. of Oceanography, Naval Postgraduate School, Monterey, CA, USA).
Remote Sensing Environ. (USA), vol.13, no.2, p.131-47 (May 1983).
An analysis of the radiative transfer processes in the atmosphere suggests that the ratio between the diffuse radiance flux and the directly transmitted flux may be a useful parameter for investigating the variation of atmospheric optical depth. The radiative parameter is derived for an observer at the top of the atmosphere in the position of a satellite. One of the important variables required in the computations of the radiative parameter is the aerosol phase function which can be satisfactorily fitted by the two-term Henyey-Greenstein function. When the surface reflectance equals zero, representing the atmospheric radiance alone without any influence from an oceanic surface, the study shows that the variation of the optical depth is associated with the changing of aerosol size distribution. The optical depth increases with the presence of large aerosol particles. The results indicate that inhomogeneities in aerosol optical properties, such as the variation of the scattering phase function due to the changes in aerosol size distribution, can affect the magnitude of the optical depth. (16 refs.)

104566 Optimal detector of laser radiation pulses transmitted by a turbulent atmosphere. R.A.Kazaryan, A.V.Oganesyan (Inst. of Phys. Res., Acad. of Sci., Ashtarak, Armenian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.144-6 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.272-6 (Feb. 1983).
An analysis is made of the reception of optical signals transmitted by a turbulent atmosphere. A rule for optimal reception of such pulses is obtained in the case when the operation of an optical detector is limited by thermal noise. Numerical modeling on a computer is used to compare optimal and nonoptimal detectors. The results of such modeling a demonstrate that an optimal detector can ensure a much lower probability of false reception than a nonoptimal one. (11 refs.)

104567 Effects of the continental aerosol microstructure on radiation attenuation at 0.4-15 μm. O.A.Lipskaya, V.V.Smirnov (Inst. of Experimental Meteorology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.7, p.27-31 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.7, p.37-41 (1982).
Measurements are reported on the dispersion of atmospheric aerosols of diameter 0.007-30 μm for ground layer air in anticyclones at the center of the European USSR, together with calculations on the attenuation at 0.3-15 μm wavelength. Approximate formulae are given for the size distributions at relative humidities of 40-95% for radiation mists and fogs. Restrictions on some optical models for the troposphere are considered. (17 refs.)

104568 The atmospheric transparency distribution. E.R.Milyutin, Yu.I.Yaremenko (Leningrad Electrochem. Communications Inst., Leningrad, USSR).
Sov. Meteorol. & Hydrol. (USA), no.9, p.83-5 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.9, p.108-10 (1982).
Data on visibility are used to determine the atmospheric transparency for the visible and near-IR. It is found that a modified truncated Weibull distribution is applicable for paths of length >5 km. (5 refs.)

104570 The Intercomparison Ozone Campaign held in France in June 1981: description of the campaign. M.L.Chanin (CNRS, Verrieres-le-Buisson, France).
Planet. & Space Sci. (GB), vol.31, no.7, p.707-15 (July 1983).
An intercomparison balloon and ground-based campaign for measuring ozone from the ground to the mesosphere was performed in the South of France from 9 June to 26 June 1981. Satellite data obtained above the sites from existing ozone experiments have also been used. A total of 11 experimental groups participated in the campaign with 15 different types of instruments. Two large stratospheric balloons were launched on 19 June and 25 June with five experiments on each; on these specific days the comparison included up to 10 types of near simultaneous ozone measurements. 104571 Atmospheric water vapor differential absorption measurements on vertical paths with a CO_2 lidar. P.W.Baker (Electronics Res. Lab., Dept. of Defence, Salisbury, Australia).
Appl. Opt. (USA), vol.22, no.15, p.2257-64 (1 Aug. 1983).
Ground based vertical path differential absorption measurements were obtained up to a height of 1.5 km with a CO_2 lidar transmitting alternatively on the $R(20)$ (10.247-μm) and $R(18)$ (10.260-μm) lines during daylight in conditions of both strong and weak temperature inversions. The differential absorption between these lines for a typical middle latitude lower atmosphere water vapor concentrations appears to be well suited to this type of measurement as the power loss on the more absorbed backscattered line [$R(20)$] is not too great as to unduly restrict the operating range, while the power differential is still sufficiently large to be readily measurable. In one set of measurements a strong temperature inversion at a height of 1 km resulted in a rapid vertical lapse in aerosol concentration with a consequent loss of SNR on the returns and severe distortion to the differential absorption profiles at this level. Water vapor profiles were derived from all measurements except in the region of the strong temperature inversion where the atmospheric backscattering cross section decayed rapidly. Reasonable results were obtained through the weak inversion region. The measurement capability of the lidar was found to be restricted by the length of the laser pulse tail and an inadequate signal-to-noise performance in regions of strong temperature inversions due to the associated decreases in aerosol concentration. (7 refs.)

104572 Airborne dual laser excitation and mapping of phytoplankton photopigments in a Gulf Stream warm core ring. F.E.Hoge, R.N.Swift (NASA Goddard Space Flight Center, Wallops Flight Facility, Wallops Island, VA, USA).
Appl. Opt. (USA), vol.22, no.15, p.2272-81 (1 Aug. 1983).
Utilization of a two-color airborne lidar system in the systematic study of a major oceanographic feature is reported here for the first time. An excimer pumped dye laser was optically and electronically integrated into the NASA Airborne Oceanographic Lidar for simultaneous use with a frequency doubled Nd:YAG laser. The output beams exit the laser system along parallel paths after being produced on an alternating pulse basis at a combined rate of 12.5 pps. Results are presented for missions flown over a Gulf Stream Warm Core Ring (WCR) as well as over shelf, slope, Gulf Stream, and Sargasso Sea waters. From the airborne data a high coherence is shown between the two-color chlorophyll *a* data and between the Nd:YAG chlorophyll *a* and phycoerythrin responses within each of these water masses. However, distinct differences in the response patterns of these photopigments are shown to exist between the differing water masses. At certain of the boundaries separating the water masses a sharp transition is seen to occur, while at others a wider transition zone was observed in which the correlation between the photopigments appears to degrade. (16 refs.)

104573 Techniques for measuring radiance in sea and air. W.H.Wells (Tetra Tech Inc., Pasadena, CA, USA).
Appl. Opt. (USA), vol.22, no.15, p.2313-21 (1 Aug. 1983).
Measurements of scattered sunlight often employ simple radiometers that are incapable of scanning azimuth ϕ and zenith angle θ. Instead, they measure integral moments of the radiance. Consider a set of $N+1$ meters designed to measure moments Λ_1 through Λ_{N+1}. If each meter is judiciously designed, the Λ_j may be processed quite simply to deduce inherent properties of the scattering medium, namely, N moments of the volume scattering function. In the optimum design, each meter has an angular response that approximates a polynomial of degree N in $\cos\theta$. The theory of these meters is based on Boltzmann's equation of radiative transfer expressed in terms of spherical harmonics, a form in which this equation is particularly simple. (11 refs.)

104574 A separator for obtaining samples of cloud water in aircraft. P.T.Walters, M.J.Moore, A.H.Webb (Central Electricity Res. Labs., Leatherhead, England).
Atmos. Environ. (GB), vol.17, no.6, p.1083-91 (1983).
In order to study the effect of SO_2 emissions from power stations on the formation of acid rain, cloud water sampled in the presence of the effluent gases is required for analysis. A small axial flow cyclone is described for separating the liquid water from cloud sampled by aircraft to provide these samples. The description covers structural aspects, the installation in the aircraft and a theoretical prediction of its service performance. It is shown that the separator will remove all droplets of greater than 5-μm diameter under the action only of the ram pressure generated by the forward speed of the aircraft. The optimisation of the design in a simple ground based cloud tunnel is then described and test results are given which indicate that adequate cloud water samples for chemical analyses should be obtained when the liquid water content of the sampled cloud exceeds 0.35 g m^{-3}. (9 refs.)

104575 Multiple level finite element analysis and its applications to tidal current flow in Tokyo Bay. M.Kawahara (Dept. of Civil Engng., Chuo Univ., Tokyo, Japan), M.Kobayashi, K.Nakata.
Appl. Math. Modelling (GB), vol.7, no.3, p.197-211 (June 1983).
A finite element method for the analysis of a one level and a multiple level current flow is presented. The basic equations can be derived from the three-dimensional Navier-Stokes equations under the shallow water assumptions. The standard finite element method has been introduced using the linear interpolation function based on a triangular finite element. For each level, the finite element subdivisions are not required to be coincident. The multiple level finite element method is applied to a tidal flow analysis of Tokyo Bay. The multiple level tidal flow analysis is performed at the entrance channel of Tokyo Bay. The density of water is assumed to be constant for each level. The vertical profiles of the numerical velocity are compared with those of the observed velocity. The flow directions and the order of velocity are both well in agreement with the observed data. The tidal flow pattern in Tokyo Bay has been shown to be expressed by the multiple level flow assuming that the density of seawater is level wise constant. The numerical tidal flow computation of Tokyo Bay carried out using a one level model is compared with observed data. The one level numerical values will be used to specify the boundary conditions for the multiple level analysis. Both numerical and observed results correspond extremely well in this computation. The two dominant circulated residual flows have been computed, and they coincide with the observed facts. (22 refs.)

104576 Continuous measurement of radon emanations from soil and groundwaters in southern France (Alpes Maritimes). Preliminary results. A.Oddou, L.Nault, R.Campredon, M.Bernat (Lab. de Geologie-Geochimie, ERA 888, Nice, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1081-6 (18 April 1983). In French.
Two types of automated instruments which monitor the emission of radon from rocks and groundwaters are actually being set up in a few localities of the French-Italian Alpes-Maritimes (SE France). The first results are presented. (17 refs.)

104577 Experience in operating high-sensitivity humidity sondes using a miniature humidity sensor with barium fluoride—a comparison with a Lyman-α-hygrometer. H.-J.Schonfeldt (Karl-Marx-Univ. Leipzig, Leipzig, Germany), A.Raabe, H.Piazena.
Z. Meteorol. (Germany), vol.33, no.2, p.116-18 (1983). In German.
A comparison of a highly sensitive miniature humidity sensor with barium fluoride with a Lyman-α-hygrometer shows under natural conditions, rather good agreement. The miniature humidity sensor has a sensitive area of 3 by 4 mm and is well suited to profile measurements. A frequency resolution of 1 Hertz has been obtained. (5 refs.)

104578 Simplified estimation of seismic moment from seismograms. B.A.Bolt (Univ. of California, Berkeley, CA, USA), M.Herraiz.
Bull. Seismol. Soc. Am. (USA), vol.73, no.3, p.735-48 (June 1983).
Proposes a method to estimate the seismic moment of regional and local earthquakes based on simple measurements made directly on Wood-Anderson seismograms. The method parallels the routine estimation of local magnitude in observatory work. Least-squares fits were made to data from 73 Wood-Anderson records of 16 central California earthquakes with seismic moments already evaluated independently from spectral analysis or broadband displacement records. (18 refs.)

104579 A new method for precise astro-azimuths. L.A.Kivioja (Surveying & Mapping, Purdue Univ., West Lafayette, IN, USA).
Bull. Geod. (France), vol.57, no.2, p.146-51 (1983).
The theodolite used in this method is completely leveled by using autocollimation from a free mercury surface. This eliminates the need for striding or

hanging levels which are in conventional use to level the trunnion axis of the theodolite. Mercury leveling is more accurate and can be performed in a much shorter time than leveling by the striding or hanging levels. In addition, this new method removes the unavoidable axis wobbles contaminating the observed horizontal angles between the star and the azimuth mark. The uncontrolled wobble errors affecting azimuths can be up to three arc seconds. The axis wobbles are removed by using autocollimation from an axis mirror which is perpendicular to the trunnion axis of the theodolite. Autocollimation coincidences from the mercury and from the axis mirror can be made within one or two tenths of an arcsecond. This new method and instrumentation surpasses the obtainable precision by the conventional first-order astro azimuth observations by reducing the unknown systematic wobble and level errors by one order of magnitude. (4 refs.)

104580 The Airborne Laser Ranging System, its capabilities and applications. W.D.Kahn, J.J.Degnan (Goddard Space Flight Center, Greenbelt, MD, USA), T.S.Englar,Jr..
Bull. Geod. (France), vol.57, no.2, p.180-94 (1983).
The Airborne Laser Ranging System is a proposed multibeam short pulse laser ranging system on board an aircraft. It simultaneously measures the distances between the aircraft and six laser retroreflectors (targets) deployed on the Earth's surface. Depending on the host aircraft and terrain characteristics, the system can interrogate hundreds of targets distributed over an area as large as 6×10^4 sq. kilometers in a matter of hours. Potentially, a total of 1.3 million individual range measurements can be made in a six hour flight. The precision of these range measurements is approximately ±1 cm. These measurements are then used in a procedure which is basically an extension of trilateration techniques to derive the intersite vector between the laser ground targets. By repeating the estimation of the intersite vector, strain and strain rate errors can be estimated. These quantities are essential for crustal dynamic studies which include determination and monitoring of regional strain in the vicinity of active fault zones, land subsidence, and edifice building preceding volcanic eruptions. (12 refs.)

104581 Determination of iron contents in boreholes by neutron capture method. Xu Fengzeng.
Nucl. Tech. (China), no.2, p.32-3 (April 1983). In Chinese.
The contents of iron and other elements at a mine site are studied experimentally by the neutron capture method. In the investigation a 512-channel pulse height analyser, a NaI(Tl) scintillation detector and an ^{241}Am-Be neutron source are used. The borehole effect has been corrected experimentally by the result obtained in a model borehole. Moreover, the relationship between the 7.64 MeV peak's area and the iron content is measured with an error less than ±10%. Neutron captured γ-ray loggings are made in five wells, and the results indicate that the iron contents are less than that detected from core analysis. The author concludes that the neutron captured γ-ray logging is applicable in geological exploration. (3 refs.)

104582 The relationship of surface γ-ray intensity with groundwater in South Spring area, Chongqing. Sun Shixiong (Chengdu Coll. of Geology, China).
Nucl. Tech. (China), no.2, p.38-9 (April 1983). In Chinese.
The paper deals with the theoretical and practical problems related to the exploration of hot water by γ-ray measurement method in karstified limestone areas of South Spring, Chongqing. It has been discovered that higher values are usually measured in the regions of hot-water-bearing structures, and lower γ values in the regions of karstified cold-water-bearing strata. The factors that influence γ values and the significance of the derived conclusions in the exploration of the terrestrial hot energy and karst water are also discussed. (no refs.)

104583 Proceedings of Workshop I of the COSPAR Twenty-Fourth Plenary Meeting.
Adv. Space Res. (GB), vol.3, no.6 (1983).
Conference held at: Ottawa, Canada. Date 16 May-2 June 1982. Sponsors: COSPAR. High-altitude balloon techniques for atmospheric, telecommunication and astronomical purposes are described. The first set of papers describe the ballon technology itself. Examples of such papers are automatic control of balloon altitude, balloon materials and design, balloon film strain measurement, the Radiation Controlled Balloon and gas replenishment in long duration ballooning. The second set of papers are about telecommunication applications and telecommand and data retrieval problems of geophysical and astronomical balloons. Other balloon operation methods include balloon power supplies and launch methods. The third chapter is of papers presenting the results of submillimetre radiowave and X-ray astronomy. Various phenomena in the stratosphere were examined in several papers, altogether 23 papers were presented.

104584 An estimate of the error in the measurement of a constant electric field by the method of a double Langmuir probe. V.E.Korepanov.
Cosmic Res. (USA), vol.20, no.5, p.486-94 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.690-9 (Sept.-Oct. 1982). [received: June 1983]
A procedure is described for the measurement of an electric field with a double Langmuir probe, and the principal components of the measurement error are estimated. A formula is derived which permits making a preliminary calculation of the error and which can be used to determine both the basic requirements on the individual subassemblies of the measuring system and the minimum possible measurement error by the method in question. (16 refs.)

104585 Intensity of 1356-Å emission as a determinant of F-region parameters. K.B.Serafimov.
Cosmic Res. (USA), vol.20, no.5, p.525-9 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.736-41 (Sept.-Oct. 1982). [received: June 1983]
Proposes some methods of correctly determining the planetary distribution of maximum electron density N_mF (or the corresponding critical frequencies f_oF), the height of these densities h_mF, and one of the most characteristic parameters describing the international reference profile $N_e(h)$ in the F region. With this in mind the author proposes two measurements of naturally occurring optical emissions in the upper atmosphere, and one local measurement of the electron density. The optical emissions are the oxygen lines at λ 1356 Å in the ultraviolet and λ 6300 Å in the red. The author derives accurate expressions for the intensity of the λ 1356 Å line, and points out certain inaccuracies in the methods which have been used up to the present time in determining N_mF and h_mF from measurements of the intensities of the two oxygen lines mentioned above. (19 refs.)

104586 Low resolution atmospheric measurements and data applications. J.R.Moulton (E-OIR Measurements Inc., College. Station, Fredericksburg, VA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.9-19 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
Overviews the application of low resolution transmissometer systems to field measurement of spectral transmission through the atmosphere. A discussion of atmospheric models, such as the Air Force LOWTRAN and the Army E-OSAEL computer Codes is followed by a description of a typical low resolution transmissometer system. The procedure to calibrate the transmissometer in order to produce absolute transmission is presented. Some typical problems associated with field measurement of atmospheric propagation is given. The author also presents spectral transmission results in the 3-5 micrometer region during GRAF I atmospheric trials in Europe. The data analyzed was provided by the Night Vision and Electro-Optics Laboratory. (3 refs.)

104587 Field system for measurement of atmospheric propagation and radiant signatures. S.T.Hanley (OptiMetrics Inc., Las Cruces, NM, USA), K.O.White.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.76-83 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
Describes a large aperture, high precision, simultaneous atmospheric propagation and radiant signature field measurement system. Novel features of the system include: simultaneous multispectral measurement of path radiance and transmission through the same air column, absolute laser calibrated transmissiometery, visible and 8-12 μm imagery with 8-bit dynamic range digital recording, 2-12 μm Fourier Transform Spectroscopy with 0.03 cm^{-1} resolution, and digital data acquisition with real time data reduction through the use of on-line minicomputers. The flexible modular approach of the system will be shown as will its ability to address many atmospheric propagation and/or radiant emission problems in a unified manner, thereby permitting separation of combined physical processes in many cases. Preliminary data acquired by the system will be presented from: SMOKE IV (November 1981, Huntsville, Alabama) showing refractive effects of thermal plumes on laser beam propagation, and SNOW 1A (January 1982, Burlington, Vermont) showing relative transmission of three broad spectral bands through falling and blowing snow utilizing a stable secondary standard IR source. (3 refs.)

104588 New developments in instrumentation for long path atmospheric transmittance and radiance measurements. A.Ben-Shalom, A.D.Devir, S.G.Lipson, U.P.Oppenheim, E.Trahovsky (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.98-105 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
Instrumentation and procedures for performing absolute spectral transmittance and radiance measurements over very long atmospheric horizontal paths, up to 50 km, are described. A collimated chopped radiation source was developed using a 64 cm diameter optical collimator and an electrically heated graphite element which operated at 2400K. For detection a 20 cm diameter spectro-radiometer was developed and used successfuly in many field measurements of absolute transmittance. The contribution of the measured data towards improving the LOWTRAN propagation model is presented. The successful development of the instrumentation and its operation make it a very powerful tool for obtaining significant absolute atmospheric transmittance data over very long horizontal paths. (5 refs.)

104589 Abyssal temperature measurements with Aanderaa current meters. P.M.Saunders, J.W.Cherriman (Inst. of Oceanographic Sci., Godalming, England).
Deep-Sea Res. Part A (GB), vol.30, no.6A, p.663-7 (June 1983).
Modifications of the Aanderaa RCM5 current meter temperature circuit are described; a sensitivity of 2.5 mC° suitable for abyssal studies is achieved. Pre- and post-cruise calibrations of a group of instruments show remarkable stability and from the internal consistency of the records the absolute accuracy is estimated near 3 mC°. Comparisons with lowered CTD observations suggest that observing climatic changes of ocean temperature of 0.01 C° is a formidable task. (4 refs.)

104590 The simultaneous use of tracers for ocean circulation studies. B.Bolin, A.Bjorkstrom, K.Holmen (Dept. of Meteorology, Univ. of Stockholm, Stockholm, Sweden), B.Moore.
Tellus Ser. B (Sweden), vol.35B, no.3, p.206-36 (July 1983).
A method for the simultaneous use of tracers for oceanic circulation studies is developed. To permit the inclusion of tracers that are subject to biochemical transformation a simple model for photosynthesis, bacterial decomposition and chemical dissolution is formulated based on the use of Redfield ratios for the chemical compounds interaction. The finite difference analogue to the steady state tracer continuity equation, applied to the tracers chosen, leads to a set of simultaneous algebraic equations that in principle can be solved by matrix inversion. The method is applied to a 12-box model of the world oceans by considering the surface water, intermediate water, deep water and bottom water of the Arctic, Atlantic, Antarctic and Pacific/Indian Oceans. (47 refs.)

104591 Compact gravity inversion. B.J.Last, K.Kubik (Inst. for Aerial Survey & Earth Sci., Delft, Netherlands).
Geophysics (USA), vol.48, no.6, p.713-21 (June 1983).
Presents a new criterion for the inversion of gravity data. The principle employed is to minimize the volume of the causative body, which is equivalent to maximizing its compactness. The anomalous density distribution is obtained using an iterative technique which is numerically stable and rapidly convergent. The principle can also be adapted to include modeling of gravity anomalies by single-density sources. (19 refs.)

104592 Composite color images of aerial gamma-ray spectrometric data. J.S.Duval (Denver Federal Center, US Geological Survey, Denver, CO, USA).
Geophysics (USA), vol.48, no.6, p.722-35 (June 1983).
Aerial gamma-ray data provide estimates of the apparent surface concentrations of potassium (K), equivalent uranium (eU), and equivalent thorium (eTh). These data can be expressed as nine radiometric parameters. A technique has been developed which combines any three of these parameters to form a composite color image, which provides a partial synthesis of the radiometric data that can be used to aid geologic mapping and mineral exploration. The sample data set, from the Freer area in south Texas, illustrates the use of the color images. (20 refs.)

104593 Electronic acceleration-sensitive geophone for seismic prospecting. K.B.Klaassen, J.C.L.Van Peppen (Dept. of Electrical Engng., Delft Univ. of Technol., Delft, Netherlands).
Geophys. Prospect. (Netherlands), vol.31, no.3, p.457-80 (June 1983).
The novel geophone described is a light-weight (17 g) acceleration-sensitive transducer which gives good ground coupling and partial correction for the increasing damping in the Earth with increasing frequencies. It employs internal hybrid electronics for a magnetodynamic velocity-nulling feedback system. Velocity nulling makes the movable part of the geophone virtually rigid with respect to the housing. This makes the geophone characteristics independent of the suspension. The springs used are stiff in a transverse and rotational direction so that the suspension resonances are well outside the useful frequency band. This suspension also allows the geophone to be used in any orientation while being only sensitive to the vibration along the main axis. (10 refs.)

104594 Practical application and preliminary interpretation techniques of in-seam seismology. T.Bodoky, E.Cziller (Eotvos Lorand Geophys. Inst. of Hungary, Budapest, Hungary), E.Toros.
Geofiz. Koeslemenyek (Hungary), vol.29, no.2, p.141-54 (June 1983).
By means of two case histories the authors present practical methods applied in Hungarian in-seam seismology and the quick-look methods of preliminary interpretation. (9 refs.)

104595 Optimisation of geological and geophysical prospecting for coal. V.Yu.Zaichenko (Min. of Geology, Moscow, USSR), V.V.Grechukhin, I.T.Kozelski.
Geofiz. Koeslemenyek (Hungary), vol.29, no.2, p.155-61 (June 1983).
New techniques are presented to optimise geological and geophysical prospecting for coal, based on analysis of the petrophysical properties of the coal-bearing formations, on the capabilities of the new techniques of coal geophysics and of their optimum combination. (8 refs.)

104596 A model study of the transient electromagnetic coincident loop technique. R.D.Ogilvy (Appl. Geophys. Unit, Inst. of Geological Sci., Keyworth, England).
Geoexploration (Netherlands), vol.21, no.4, p.231-64 (1983).
A free-space parametric model study of the Transient Electromagnetic coincident loop technique is undertaken to provide a basic scheme for the interpretation of coincident loop anomalies and to provide insight on the important survey design parameters. Experiments are carried out to investigate the effects of changing geometrical relationships, target conductance, lateral resolution in the case of multiple thin dykes, and the masking influence of conductive overburden. (15 refs.)

104597 Correlative studies of satellite ozone sensor measurements. J.E.Lovill, J.S.Ellis (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Geophys. Res. Lett. (USA), vol.10, no.6, p.447-50 (June 1983).
Comparisons are made between total ozone measurements made by four satellite ozone sensors (TOMS, SBUV, TOVS and MFR). The comparisons were made during July 1979 when all sensors were operating simultaneously. The TOMS and SBUV sensors were observed to measure less total ozone than the MFR sensor, 10 and 15 Dobson units (DU) respectively. The MFR and TOMS sensors measured less ozone than the TOVS sensor, 19 and 28 DU, respectively. Latitudinal variability of the total ozone comparisons is discussed. (7 refs.)

104598 Construction of M_{max} earthquake maps based on a method of approximating spaced expert estimates. V.G.Gitis, M.A.Mironov, V.T.Bune (O.Yu. Schmidt Inst. of Phys. of Earth, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.4, p.264-73 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.4 (1982).
The initial information consists of geological, geophysical, and seismological maps characterising potential seismic danger, expert estimates for the M_{max} values for sampling points, and information on the maximum recorded magnitudes of earthquakes. A class of functions is assigned in which a relationship is sought between M_{max} and the characteristics being measured. The mathematical stipulation developed permits the most informative characteristics for prediction to be selected, a prediction function to be calculated, a prediction map to be constructed for M_{max}, and the results to be presented in a form suitable for analysis. Two variants are described for constructing an M_{max} map for earthquakes in Bulgaria. (10 refs.)

104599 Deep ocean temperature profile measurements. T.M.Dauphinee (Div. of Phys., Nat. Res. Council, Ottawa, Ontario, Canada).
IEEE J. Oceanic Eng. (USA), vol.OE-8, no.3, p.184-95 (July 1983).
The ocean temperature range is narrow, −2 to 35°C, but measurement is complicated by the harsh ocean environment, the necessity of remote hands off readings, power limitations due to the cable, and the fast response required to obtain a profile in a reasonable length of time. Platinum and copper thermometers are used for most precision measurements with thermistors or thermocouples used in some cases to improve speed of response and for lesser accuracy. A number of very different circuits have been used successfully in salinity, temperature, and depth profiling systems and achieve millidegree accuracies in laboratory measurements. However, very careful precautions and many checks are required to achieve that accuracy in the field, and to achieve the correlation of conductivity, pressure, and temperature readings required for equivalent accuracy in the salinity and density measurements. (18 refs.)

104600 Multifrequency remote acoustic sensing of suspended materials in water. Y.Ma, V.K.Varadan, V.V.Varadan, K.W.Bedford (Dept. of Engng. Mech., Ohio State Univ., Columbus, OH, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.581-5 (Aug. 1983).
A multifrequency acoustic technique is employed as an oceanographic tool to infer the characteristic information e.g., concentration, size distribution, and mean size, about suspended materials in the deep ocean environment. The technique employs the single scattering theory which is valid for a sparse distribution of scatterers in water. Theoretical results are presented as the acoustic response versus frequencies for different size distributions. (15 refs.)

104601 An objective procedure for detecting and correcting errors in geophysical data. II. Multidimensional applications. H.E.Fleming, M.L.Hill (Nat. Environmental Satellite Data, & Information Service, NOAA, Washington, DC, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3859-67 (20 April 1983).
For pt.I, see ibid., vol.87, C9, p.7312-24 (1982). The one-dimensional objective procedure for detecting and then correcting errors arising in geophysical data, developed in the previous paper of this series, is extended to higher dimensions. The data again must be sampled at equal increments of time or distance, but the spacings can be different in each dimension. Of interest are only those errors larger in magnitude than the background noise level. Underlying the success of the error detection and correction procedure is the alternating subset method, which is extended to higher dimensions. Complete step-by-step instructions are given for the two-dimensional procedure. (4 refs.)

104602 An aerosol and gas sampling apparatus for remote observatory use. W.D.Komhyr (Air Resources Labs., NOAA, Boulder, CO, USA).
J. Geophys. Res. (USA), vol.88, no.C6, p.3913-18 (20 April 1983).
An air sampling apparatus is described which standardizes sampling height at a field station at 10 m or more above ground level and which minimizes loss of particles and destruction and contamination of sampled trace atmospheric gases as air is conducted through the apparatus to various monitoring instruments. Basic design features render the apparatus useful for air sampling under widely varying climate conditions, and at station altitudes ranging from sea level to more than 4 km. Four systems have been built, and have been used successfully since 1977 at the NOAA Geophysical Monitoring for Climatic Change program baseline stations. (13 refs.)

104603 Sea floor measurement of geomagnetic field using newly developed ocean bottom magnetometers. J.Segawa (Ocean Res. Inst., Univ. of Tokyo, Tokyo, Japan), T.Yukutake, Y.Hamano, T.Kasuga, H.Utada.
J. Geomagn. & Geoelectr. (Japan), vol.34, no.10, p.571-85 (1982).
An ocean bottom magnetometer is developed. It is a fluxgate type magnetometer with a triaxial ring-core sensor suspended by a gimbal, and capable of recording the three geomagnetic components in a cassette tape in digital form for more than two months when the sampling interval is 3 min. The resolution is 0.8 nT in this case. A pop-up system is adopted for recovery, mechanically releasing a weight at a preset time by explosion of gas. Two sets of magnetometers were used at two sea floor stations on the continental shelf east of northeast Honshu in 1981. One was a prototype and the other was an improved instrument. The details of the improved instrument (named OBM-C2) as well as the data obtained from the measurements are reported. (7 refs.)

104604 Application of lasers in oceanographic investigations (review). A.P.Ivanov, I.I.Kalinin, A.I.Kolesnik.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1097-103 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.533-40 (Oct. 1982).
The creation of lasers led to the development of a new effective method for studying the environment: laser sounding. This method demonstrated the extensive possibilities in studying the atmosphere by different methods: aerosol, resonance and Raman scattering, and fluorescence. This approach can be applied to studying the ocean environment, although a number of difficulties arise related to the greater turbidity, smaller scales of inhomogeneities, effect of the water-air interface, overlapping of the spectral characteristics of the components of the medium, etc. The purpose of the paper is to review the foreign (i.e. non-Soviet) publications concerned with the use of fluorescence and RS for studying pollution by petroleum and petroleum products, the concentration of chlorophyll *a*, temperature, and salinity of the water. (28 refs.)

104605 Specifications for a probe to measure CO_2 fluxes in the atmosphere. P.Mestayer, J.P.Barboux, M.Coantic (Inst. de Mecanique Statistique de la Turbulence, Marseille, France).
J. Rech. Atmos. (France), vol.17, no.1, p.13-31 (Jan.-March 1983). In French.
The characteristic parameters (sampling volume, frequency response and signal-to-noise ratio) of a probe to measure the turbulent fluctuations of a passive scalar contaminant in order to estimate its fluxes can be deduced from the atmospheric surface layer semi-empirical universal relationship. This method is applied to predict the characteristics of a probe to estimated CO_2 fluxes in the atmospheric surface layer over the ocean and in the IMST simulation tunnel. (24 refs.)

104606 On the measurement of total cloud water content with the Ruskin probe: advantages and limitations. J.P.Pinty, R.Rosset (Univ. de Clermont-Ferrand II, Aubiere, France).
J. Rech. Atmos. (France), vol.17, no.1, p.67-76 (Jan.-March 1983). In French.
Performances of the Ruskin probe for the measurement of total cloud water contents have been studied both theoretically and experimentally for several field experiments performed by LAMP: Moussafrica 1977, Wamex 1979, PEP 1979. After a previous study about clouds with only small droplets present, the intercomparison between the Ruskin, PMS and Johnson-Williams probes is extended to clouds with large drops and ice particles. (7 refs.)

104607 A technique for studying density gradients and motions of plasmaspheric irregularities. D.Jones (British Antarctic Survey, NERC, Univ. of Cambridge, Cambridge, England).
J. Geophys. (Germany), vol.52, no.3, p.158-66 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
Terrestrial myriametric radiation (TMR) is received by spacecraft in the magnetospheric cavity beyond the plasmasphere. There is now general agreement that the radiation emanates mainly from the plasmapause. A technique is under development which allows information on the source regions to be extracted. The method is based on the theory that the radiation has passed through a radio window, this being one mechanism for producing TMR which is receiving considerable attention at present. It is shown how the radial and local-time positions of the TMR sources can be determined, thereby allowing the tracking of plasmapause irregularities and regions of detached plasma which move around from the night side. It is shown how it may also be possible to determine the latitudinal positions of sources. (29 refs.)

104608 The frequency domain and the linear filtering of gravity and magnetic data. A.Mesko.
Magy. Geofiz. (Hungary), vol.24, no.2, p.43-76 (1983). In Hungarian.
The application of two-dimensional digital filters to the transformation of gravity and magnetic data has become a standard tool of routine processing in the last decade. The purpose of the present paper is to review the role of the frequency domain in describing, designing and implementing two-dimensional filters. Starting with basic principles, such as the two-dimensional Fourier transform, two-dimensional digital Fourier transform (DFT), two-dimensional cyclic non-cyclic convolutions, it describes the techniques, to be used in filtering in the frequency domain. A large class of transformations, routinely used in the processing of gravity and magnetic data can be considered two-dimensional filters. The transfer functions of these transformations are derived, including continuations upwards and downwards, vertical and horizontal derivatives, reduction to the magnetic pole and transformations and magnetic field vector and components to other components. The necessity of modifications for practical applicability is pointed out. (26 refs.)

104609 An apparatus for the measurement of radon in sea water. T.Okubo, M.Michijima (Dept. of Nuclear Engng., Kobe Univ. of Mercantile Marine, Kobe, Japan).
Oyo Buturi (Japan), vol.52, no.5, p.437-42 (May 1983). In Japanese.
For the determination of the low concentration of ^{222}Rn in sea water, an improved ^{222}Rn extraction and counting system was developed. The ^{222}Rn in a 20 *l* sample bottle was extracted from sea water with helium and collected in a charcoal trap cooled with dry ice and alcohol. The ^{222}Rn extraction is accomplished by two circulation loops in a closed system: one is the rapid extraction loop of ^{222}Rn from sample water by violent gas bubbling and strong agitation, and the other is the adsorption loop of ^{222}Rn with a cooled charcoal trap. Sucessively, the ^{222}Rn was desorbed from the trap by heating and transferred to a scintillation cell coated with ZnS(Ag). Following these procedures one can process a sample in 100 min with an overall efficiency (extraction-transfer-counting) of 57%. Some results in ^{222}Rn and ^{226}Ra concentrations in coastal sea water are reported. (25 refs.)

104610 The use of multispectral satellite imagery in the exploration for petroleum and minerals. E.R.Peters (Hunting Geology & Geophys. Ltd., Borehamwood, England).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.243-55 (1983).
Reviews the application of multispectral satellite imagery to mineral and petroleum exploration, from the stage when satellite imagery first became

available, with the launch of ERTS-1 (Landsat) just over 10 years ago, to the present day. The operation of Landsat is briefly described, and it is noted that the continuing success of this system for geological application has been in part due to the development of a worldwide network of receiving stations and the application of sophisticated data-processing techniques. Current research into the measurement of infrared spectra for the discrimination of rocks and minerals is discussed. Interpretation techniques are important but their success depends largely upon the experience of the interpreters as geologists. Examples of the use of Landsat imagery in exploration are given, and interpretational techniques are reviewed. (39 refs.)

104611 Synthetic aperture radar observations of ocean and land. R.K.Raney (Canada Centre for Remote Sensing, Dept. of Energy, Mines & Resources, Ottawa, Canada).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.317-23 (1983).
A brief history of synthetic aperture radar (SAR) from early radar ideas to recent satellite systems is presented. Properties of electromagnetic radar measurement that are fundamental to SAR systems are presented and discussed by the use of example SAR images derived from airborne and Seasat satellite sources. The next decade of activity in radar satellites is outlined. (5 refs.)

104612 Detection of large-scale ocean circulation and tides. D.E.Cartwright (Inst. of Oceanographic Sci., Bidston Obs., Birkenhead, England).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.363-72 (1983).
The prospect of nearly continuous recording of ocean-surface topography by satellite altimetry with suitable supporting measurements might make basin-wide dynamics monitoring possible. The associated identification of the geocentric oceanic tidal signal in the data would be an additional bonus. The few weeks of altimetry recorded by Seasat gave a glimpse of the possibilities, but also clarified the areas where better precision and knowledge are needed. Further experience will be gained from currently projected multi-purpose satellites carrying altimeters, but serious knowledge of ocean circulation will result only from missions that are entirely dedicated to the precise measurement of ocean topography. (23 refs.)

104613 Observation of ocean waves. M.J.Tucker (Inst. of Oceanographic Sci., Taunton, England).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.373-82 (1983).
The European Space Agency plans to launch an Earth Resources Satellite (ERS-1) in a few years' time with a view to establishing an operational system of such satellites. It will carry two microwave devices giving information on waves: a precision altimeter and a synthetic aperture radar (SAR). In the precision altimeter, the leading edge of the returned radar pulse is smeared by the rough sea surface. The degree of smearing is highly correlated with the significant waveheight. The main fundamental limitation to operational use comes from the sampling variability, which necessitates long averaging times. The SAR gives pictures of the sea surface that often show wave patterns, but their precise interpretation is an exceedingly complex problem. The small number of satellites planned will mean that coverage of coastal areas will be poor. (9 refs.)

104614 Observations of sea-surface temperature for climate research. J.E.Harries, D.T.Llewellyn-Jones, P.J.Minnett, R.W.Saunders, A.M.Zavody (Rutherford Appleton Lab., Didcot, England).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.383-96 (1983).
The measurement of global sea-surface temperature (SST) from space, with high absolute accuracy, is one of the important requirements of the World Climate Research Programme (WCRP). This paper considers the definition of measurement aims based on considerations of specific types of scientific problem, and gives as examples discussion of two particular problems, first the possible influence of Pacific SST on the lower stratosphere, and second the role of SST in the cloud-climate feedback process. Following this, a brief review is presented on current status in satellite measurements of SST with both infrared and microwave techniques, and the paper concludes with a description of a future SST-measuring instrument, the Along-Track Scanning Radiometer (ATSR). (25 refs.)

104615 A review of Seasat scatterometer data. T.H.Guymer (Inst. of Oceanographic Sci., Godalming, England).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.401-16 (1983).
A microwave scatterometer operating at 14.6 GHz was one of several sensors on Seasat that provided data of the sea surface. The technique by which estimates of the near-surface wind velocity can be obtained is described and studies to assess the accuracy of such data are reviewed. With few exceptions wind speed can be retrieved to ± 1.6 m s^{-1} and direction to $\pm 17°$ for winds between 3 and 16 m s^{-1}, and the technique is useful up to at least 25 m s^{-1}. The ability to measure wind on a near-global basis with a spatial resolution of 50 km is of great importance for meteorology and oceanography. (70 refs.)

104616 Satellite observations of ocean colour. I.S.Robinson (Dept. of Oceanography, Univ. of Southampton, Southampton, England).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.417-32 (1983).
Ocean colour is unique among the properties of the sea that can be measured from satellites because visible wavelength radiation penetrates below the surface skin and contains direct information about the bulk water quality in the upper few metres of the sea. With reference to Nimbus CZCS and Landsat MSS data, this review examines three aspects of ocean-colour monitoring: the removal of atmospheric effects, which make up a large proportion of the visible signal reaching the satellite; the calibration of the ocean colour signal in terms of more useful ocean parameters such as sediment load, chlorophyll concentration, water depth or the depth of the euphotic zone; and the potential applications of colour-monitoring satellites to oceanography. (76 refs.)

104617 Application of microwave remote sensing to studies of sea ice. P.E.Gudmandsen (Electromagnetics Inst., Tech. Univ. of Denmark, Lyngby, Denmark).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.435-47 (1983).
Microwave remote sensing is the only technique that may deliver reliable and timely data irrespective of light, weather and cloud conditions. In the polar regions, this feature is of utmost importance in sea ice studies. All known microwave remote-sensing techniques have demonstrated their applicability in polar regions, in particular in connection with observations of sea ice. It has also been shown that a combination of simultaneously acquired data from different sensors may be of advantage in parameter retrieval. This paper reviews the monitoring requirements and the microwave techniques available for this purpose with a view to snow and sea ice research and applications. (22 refs.)

104618 Satellite observations of polar ice fields. G.deQ.Robin, D.J.Drewry, V.A.Squire (Scott Polar Res. Inst., Univ. of Cambridge, Cambridge, England).
Philos. Trans. R. Soc. London A (GB), vol.309, no.1508, p.449-63 (1983).
Outlines the research needed to advance the knowledge of polar ice masses that could be or has been provided by satellite techniques. Inland ice sheets, ice shelves and pack ice on polar oceans are discussed in separate sections. Because a satellite radar altimeter can cover wide areas of polar ice economically and rapidly, the interpretation of altimeter results is discussed in detail. Theoretical considerations are used to explain various characteristics of pulse shapes recorded over Antarctica by Seasat. Over inland ice, surface undulations cause the pulse shape to change rapidly with location, and the leading edge to migrate rapidly. Altimetry over ice shelves should be accurate to better than ± 1 m and provide new methods for studying their mass balance. (42 refs.)

104619 Contribution to the metrological study of radiometers. A radiometer test-chamber. H.Boyen.
Publ. Inst. R. Meteorol. Belg. Ser. A (Belgium), no.108, p.1-25 (1981). [received: Aug. 1983]
A test-chamber especially equipped to study the dynamic behaviour of radiometers and to calibrate pyrradiometers is described. To simulate environmental conditions, temperature as well as humidity and, to some extent, also ventilation speed inside of the test-chamber can be preset within fixed limits. Short-wave radiometers response may be controlled against a Xenon illuminator. The characteristics of two kinds of thermal radiators, viz. a cylindrical cavity and a large area cavity array, are discussed. An Eppley spectral precision pyranometer and a pyrradiometer of the shielded type have been tested to bring out the capabilities of the test-chamber. (6 refs.)

104620 Generalised study of the suppression principle and its associate equivalence for the three-layer case. Detectability of a stratum by the VES method. M.C.Hernandez (Catedra de Geofisica, Univ. Complutense, Madrid, Spain).
Rev. Geofis. (Spain), vol.38, no.2, p.121-31 (1982). In Spanish.
A generalisation of the suppression's principle and its associate equivalence for the three-layer case in vertical electrical soundings (Schlumberger array) is described. This generalisation may be applied to those beds whose resistivities are not intermediate between those immediately above and below and that may be missed in the interpretation. The ranges of thickness and resistivities for which the presence of an intermediate layer can be established, allowing for a maximum error of 5% in the apparent resistivity field curve, are discussed. The results are shown graphically. (7 refs.)

104621 A tilting bucket automatic rain-gauge. M.Puigcerver, S.Alonso, J.Lorente (Dept. de Fisica de la Tierra y del Cosmos, Univ. de Barcelona, Barcelona, Spain).
Rev. Geofis. (Spain), vol.38, no.2, p.139-48 (1982). In Spanish.
A state-of-rainfall gauge has been constructed using as far as possible commercially available parts. The collector is of the tilting-bucket type, an electrical impulse being sent each time the bucket tilts. This is received by a control unit with a logic circuit and a quartz clock with LED display connected to a printer through a BCD interface. Each time an impulse is received from the collector, the control unit commands the printer to record the clock display. The printout is thus just time, and the rainfall rate can be easily derived once the bucket volume is known. Some recorded examples are presented. The operating characteristics of the system are discussed. (24 refs.)

104622 Note on the detectability of a layer by the VES method. E.Orellana (Catedra de Geofisica, Univ. Complutense, Madrid, Spain).
Rev. Geofis. (Spain), vol.38, no.2, p.149-54 (1982). In Spanish.
The conditions in which a layer, located at certain depth in a geoelectrical section, should satisfy in order to be detectable by means of a VES (Vertical Electrical Sounding) are studied. There are three possibilities regarding the detectability of a layer of assumed parameters: (a) the layer presence can be affirmed, making allowance for equivalence; (b) the VES curve is incompatible with the existence of the layer; (c) the curve is compatible with the layer, but the presence of it cannot be asserted. After studying several selected cases it is concluded that the detectability of a layer does not depend only on its relative thickness, but also on its resistivity contrast with the upper and lower layers on its relative parameters of Dar Zarrouk and on the accepted margin of error. (5 refs.)

104623 Numerical inversion method for application to the interpretation of seismic profiles. E.Surinach (Catedra de Geofisica, Univ. Complutense, Madrid, Spain).
Rev. Geofis. (Spain), vol.38, no.2, p.155-66 (1982). In Spanish.
The application of numerical inversion techniques to interpretation of data of seismic soundings allows one to obtain models of the crustal structure and their errors bounds. Two inversion techniques are presented, one for layered media with constant velocities and another for continuous variation of velocity with depth. In the first case, the Lanczos generalised inverse is utilised and in the second case extremal inversion and Tau methods. Both techniques are applied to the interpretation of a seismic profile through the Iberian Meseta and their results compared and discussed. (17 refs.)

104624 New techniques [in geodesy]. V.L.Pisacane (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.585-92 (April 1983).
Reviews developments in positioning, terrain contouring, gravity and time measurement techniques during the period 1979-82. (129 refs.)

104625 New method of laser probing of the atmosphere, based on reception of echo signal at the laser. A.P.Godlevskii, V.E.Zuev, A.K.Ivanov, Yu.D.Kopytin (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.935-7 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.343-7 (Nov. 1982).
Laser methods of probing the atmosphere are in wide use. The known methods all have a typical functional separation of the transmitting and receiving units. The authors describe a new, highly sensitive method of laser probing of the atmosphere, based on effects in the intraresonator laser reception of the echo signals (the LR lidar method) when a mirror or natural diffusive reflector (a cloud layer, local topographical features, etc.) is used. (3 refs.)

104626 Combined sounding of the atmosphere by aerosol and Raman lidars. Yu.F.Arshinov, Yu.S.Balin, S.M.Bobrovnikov, I.A.Razenkov (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.217-21 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.390-7 (Feb. 1983).
A combined sounding of the atmosphere was carried out using aerosol and Raman lidars. It was found that in the case of a moderate mist the variations in the echo signal, determined in a time interval of 25 sec, were within the range 3-15%, whereas in the case of a dense mist and during rain such variations reached 50%. An increase in the relative humidity resulted in both an increase and a decrease in the echo signal due to the aerosol scattering. A calculation was made of the coefficients representing mutual correlation of the echo signals with one another and with meteorological parameters. The precision of the recording channel of the aerosol lidar was estimated using the Raman lidar as a control device. It was established that the relative error in

the determination of the echo signal by the aerosol lidar was within the range 3-6%. (5 refs.)

104627 Calculation of maximum discharges in a multiflood regime. B.Ya.Kagan.
Sov. Meteorol. & Hydrol. (USA), no.5, p.65-73 (1982). Translation of: *Meteorol. & Gidrol. (USSR),* no.5, p.80-90 (1982).
A method is proposed for calculating maximum discharges in a multiflood regime based on the use of information about all practically significant floods, plotting probability curves of each flood, and converting these curves to maximum discharge probability curves for increasing the reliability of hydrologic substantiation of the designs of hydraulic structures. (11 refs.)

104628 On the least squares solution to optimisation equations arising in problems of terrestrial photogrammetry. H.-U.Schulz (Tech. Univ. Dresden, Dresden, Germany).
Wiss. Z. Tech. Univ. Dresden (Germany), vol.31, no.5, p.182-6 (1982). In German. [received: May 1983]
The work described arises out of the part played by improvements in software, in optimising the performance of photogrammetric apparatus and in achieving maximum economy of computer capacity and time. It deals with numerical processes applied to concrete smoothing problems in terrestrial photogrammetry which provide a mean square solution to the linear system of optimisation equations without calculation of the normal equations. The orthogonalisation process of Schmidt and the methods of conjugated gradients of Hestenes-Stiefel are examined, their advantages and disadvantages discussed, and the accuracy achieved in practical examples analysed. (6 refs.) *C.J.O.G.*

104629 NEXRAD—weather radar for the future. J.D.Bonewitz (Nexrad, Silver Spring, MD, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.4/1/1-7
Currently, aging weather radars and air traffic control radars are being used to obtain information concerning the location, intensity, and movement of hazardous weather activity. However the present weather radars lack the capability to detect wind-related weather phenomena and have increasingly severe maintenance problems. The air traffic control radars also lack wind related detection capability and, because they are not optimized for weather detection, have limited reflectivity (precipitation) related capability as well. As a result the author proposes a common new Next Generation Weather Radar (NEXRAD) System. This national system will meet requirements for hazardous weather information within limitations imposed by cost and technical feasibility. It represents a major upgrading of existing capability, primarily through application of the Doppler principle, the use of solid-state technology, and improved communication, display, and data processing devices. (13 refs.)

104630 Coordinated radar and aircraft observation of turbulence. M.Labitt (Lincoln Lab., MIT, Lexington, MA, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.4/2/1-11
Lincoln Laboratory, under a program sponsored by the Federal Aviation Administration, has undertaken to measure and correlate radar- and aircraft-sensed turbulence in rainstorms. The author presents interim results of these measurements. Results of the measurements are expected to provide guidance in the design of equipment that will display areas of hazardous turbulence with confidence. Plots of turbulence levels measured simultaneously by a ground radar and an aircraft are shown to illustrate the correlation. Comparisons of the turbulence levels with the rain reflectivity are also made. (5 refs.)

104631 Latest developments in Doppler weather radar. R.A.Dill (Equipment Div., Raytheon Co., Wayland, MA, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.4/4/1-6
Doppler weather radar has made significant advances since Smith and Holmes' initial experiments (1961). The most recent of these are discussed. They generally fall into three categories: waveform; display; and signal processing. In addition, there are significant advances being made in hardware technology that will permit faster, better or lower cost implementation of some of the above and they are touched on briefly as an indication of future techniques applicable to radar in general that might find their way into Doppler weather radars. (19 refs.)

104632 The dynamic least square algorithm and its application to the location of seismic events. B.R.Suresh, R.K.Aggarwal (Honeywell Systems & Res. Center, Minneapolis, MN, USA).
1983 IEEE International Symposium on Circuits and Systems, Newport Beach, CA, USA, 2-4 May 1983 (New York, USA: IEEE 1983), p.1384-7 vol.3
The time difference of arrival (TDOA) between two waveforms is quite useful in range and bearing estimation of seismic events. The TDOA can be calculated by cross-correlating the two waves and locating the peak in the cross-correlation. However, when a seismic signal is cross-correlated, multiple spurious peaks occur in the cross-correlation function due to seismic multimode and multipath progagation. The authors propose the dynamic least square (DLS) algorithm, which is a technique for isolating the genuine peak from the spurious ones in a computationally efficient manner. (2 refs.)

94.00 AERONOMY AND SPACE PHYSICS

94.10 PHYSICS OF THE NEUTRAL ATMOSPHERE

(for planets, see 96.30)

104633 Upper atmosphere density derived from Interkosmos 10 data. L.Sehnal (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.178-84 (June 1983).
Densities of the upper atmosphere at 272 km are derived from the analysis of the mean daily motion of the Interkosmos 10 satellite (1973-82A) within the interval of MJD 42457 to MJD 43280. The observed densities are compared to three different models (DTM, MSIS, and C) and the ballistic coefficient is computed. (6 refs.)

104634 Use of incoherent-scatter data for determination of aeronomic quantities at F_2 altitudes; annual variations in atomic oxygen. A.V.Mikhaylov, G.I.Ostrovskiy (Inst. of Appl. Geophys., State Committee on Hydrometeorology, USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.44-8 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
A method is proposed for determining aeronomic quantities at altitudes corresponding to the F_2 layer from incoherent-scatter data. It is concluded that there are significant variations in the amount of atomic oxygen in the upper atmosphere over the course of a year and from day to day. These variations are not described by existing models. Additional factors must therefore be incorporated in the models for the neutral composition of the upper atmosphere. (22 refs.)

104635 Effect of ionospheric plasma on the general circulation in the upper atmosphere. II. A.G.Khantadze, A.I.Gvelesiani (Inst. of Geophys., Acad. of Sci., Georgian SSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.49-51 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
For pt.I see Geomagn. & Aeron. (USSR), vol.21, no.6, p.988 or Geomagn. & Aeron (USA), vol.21, no.6, p.733-5 (1981). A global pattern of the general circulation at ionospheric altitudes is derived through a numerical solution of the equations of motion. A model ionosphere and the Jacchia-70 model for the neutral atmosphere are used. (5 refs.)

104636 Perturbation of the neutral atmosphere by the spherical terminator. V.M.Somsikov (Acad. of Sci., Kazakh SSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.56-9 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
Linearized equations of gas dynamics are analyzed in a spherical coordinate system fixed with respect to the Sun. The effect of the temperature gradient in the atmosphere on the natural wave spectrum is analyzed. A model for the terminator is derived in the spherical coordinate system and used to determine perturbations of the atmospheric pressure. The terminator contribution to the overall perturbation caused by the solar heating of the atmosphere is analyzed. (8 refs.)

104637 Regular vertical motions in the lower thermosphere near the mesopause. Yu.I.Portnyagin, T.V.Solov'yeva (Inst. of Experimental Meteorology, State Committee on Hydrometeorology, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.196-8 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The latitude profile of the average annual departure from the geostrophic wind is plotted for a height $\sim$95 km. The latitude profile of the average annual vertical wind is calculated from the conservation of angular momentum flux. It is concluded that there is a regular vertical transport of masses of air in the meteor zone of the atmosphere. This vertical transport can be described by several global circulation cells in the meridional plane. (8 refs.)

104638 Mathematical modelling and analysis of the fluid dynamics of upper atmosphere dumbbell satellites. M.G.Zavattaro Chiado Piat (Dipartimento di Matematica, Politechnico Torino, Torino, Italy).
Mech. Res. Commun. (GB), vol.10, no.3, p.157-62 (May-June 1983).
The study of the physics of the interactions between a free molecule hyperthermal stream and a convex body plays an important role in upper atmosphere fluid dynamics. The author presents the calculation of the aerodynamic coefficients for satellites consisting of two spheres connected by a tether of variable length. This geometry is relevant for gravity oriented satellites. (8 refs.)

104639 Altitude-latitude structure of the mean annual zonal wind in the mesopause-lower thermosphere region. Yu.I.Portnyagin (Inst. of Experimental Meteorology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.9, p.24-9 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.9, p.34-41 (1982).
Considers the zonal wind speed in the mesopause-lower thermosphere region for 34 radio meteor and ionospheric stations in high, temperature, and low latitudes in both hemispheres. An altitude-latitude section of the mean annual zonal wind can be constructed for heights of 70-110 km in the mean zonal approximation. A characteristic feature of this section is that there is a certain degree of asymmetry between the zonal-circulation structures in the northern and southern hemispheres. (32 refs.)

94.10S Aurora

104640 Celestial winds, polar lights. F.Reddy.
Astronomy (USA), vol.11, no.8, p.6-15 (Aug. 1983).
Describes the magnetosphere, the aurora, the radiation belts, solar particle streams, IGY results, the auroral oval, the Dynamics Explorer mission and observations of the theta arc. (no refs.)

104641 Effect of solar wind velocity on the position and structure of auroras in the midnight sector. V.G.Vorob'yev, V.L.Zverev (Polar Geophys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.60-3 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
The effect of the solar wind velocity on the boundaries of the auroral oval near midnight is studied. At negative values of the B_z component of the interplanetary magnetic field, an increase in the velocity of the solar wind shifts the boundary of the auroral zone on the polar side to a higher latitude and that on the equatorial side to a lower latitude (with respect to their average positions). If $B_z>0$, an increase in the solar wind velocity is accompanied by an expansion of the auroral band and a shift toward lower latitudes. (10 refs.)

104642 Generation of a quiet auroral arc. S.V.Leont'yev, V.B.Lyatskiy (Polar Geophys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.199-202 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
A new model is proposed for the generation of an auroral arc. This model has a system of oblique currents appearing above the arc as the magnetospheric plasma drifts in the direction across the arc. (11 refs.)

104643 Measurements of temporal variations of the brightness of the aurora and emission layers from the orbiting space station Salyut-6. S.V.Avakyan, G.A.Dolgopolov, L.S.Yevlashin, A.S.Ivanchenkov, V.V.Kovalenok, G.M.Kolesnikov, T.A.Kornilova, G.M.Kravchenko, A.I.Lazarev, A.N.Svirskiy, G.V.Starkov, S.A.Chernous (Polar Geophys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.203-5 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
Results of observations of auroras and emission layers from the orbiting station Salyut-6, made in 1978, are reported. A comparison of the variations of the emissions from these two sources demonstrates their synchroneity. (10 refs.)

104644 Altitudinal distribution of hydrogen luminescence in auroras, as measured by geophysical rockets launched from Franz-Josef Land. T.M.Tarasova, O.I.Yagodkina, L.S.Yevlashin, A.I.Lazarev, M.V.Orlova (Polar Geophys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.206-9 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The results of four rocket launches from Heiss Island, Franz-Josef Land, at various levels of geomagnetic activity and MLT are discussed. It is shown that the hydrogen emission, generated by injected protons, has its maximum at the altitude of 120 to 140 km, which is above the emission generated by precipitating electrons. (13 refs.)

104645 Radioaurora altitudes. E.E.Timofeyev, Yu.G.Miroshnikov, T.N.Khor'kova, T.V.Miroshnikova (Polar Geophys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.210-12 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
Measurements of vertical characteristics of auroral backscattering above the Kola Peninsula, using a double vertical interferometer, are presented. The authors find differences in radioauroral altitudes in the zones of the eastern and western electrojets, a correlation between the altitudes of auroral inhomogeneities and of the auroral E_{sr} layer, and a vertical stratification structure of the auroral backscattering. (12 refs.)

94.20 PHYSICS OF THE IONOSPHERE

(for planets, see 96.30)

104646 Geophysical invariance of the lower part of the F region of the ionosphere. G.S.Ivanov-Kholodnyy, Yu.K.Kalinin (Inst. of Appl. Geophys., State Office of Hydrology & Meteorology, USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.17-20 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
The idea of invariant properties of the lower region of the *F*-region is introduced based on electron concentration profiles in the altitude range 150 to 200 km. The observed stability of the delay of round-the-world signals is treated. (10 refs.)

104647 Structure of the daytime equatorial ionosphere. G.F.Dyominova (Inst. of Terrestrial Magnetism, Ionosphere & Radiowave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.21-4 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
The altitudinal distribution of the concentration and temperature of charged particles above the magnetic equator in the altitude range 100 to 2000 km at midday under quiet geomagnetic conditions and different levels of solar activity is obtained by solving analytically the system of equations for the ionospheric plasma. The electron temperature has a maximum near 250 km, which agrees with observations. The isothermal region ($T_e \approx T_n$) is located in the altitude range 380 to 500 km in the case of low, and 380 to 650 km in high solar activity. (14 refs.)

104648 Nonstationary processes accompanying the perturbation of the nighttime polar ionosphere by radio waves. I.N.Bardeyev, A.V.Gurevich, Ya.S.Dimant, I.N.Kapustin, A.M.Royzen, A.A.Ul'Yanchenko (Inst. of Terrestrial Magnetism, Ionosphere & Radiowave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.25-8 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
Plasma motion in the *F*-layer of the nighttime polar ionosphere, induced by the action of strong radio waves, is investigated. A Doppler shift in the frequency of the probing radio signal passing through the perturbed region is observed. The theory of the effect is derived, and the results computed show adequate agreement between the theory and observations. (9 refs.)

104649 Current excitation in the geomagnetic pulsation range by strong radiowaves. N.D.Borisov, I.P.Zolotarev (Inst. of Terrestrial Magnetism, Ionosphere & Radiowave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.29-32 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
The structure of the additional current system and the structure of concentration perturbations produced under the action of strong modulated HF radiation on the ionosphere, are investigated. It is shown that when the modulation frequency lies in the geomagnetic pulsation range, concentration perturbations can be generated in the conjugate part of the ionosphere in the other hemisphere and the external electric field can induce transport of plasma out of the heated region. (7 refs.)

104650 Generation of acoustical gravitational waves by auroral electrojets. V.V.Kulikov (Inst. of Terrestrial Magnetism, Ionosphere & Radiowave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.33-6 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
Analytical solutions are obtained for the linearized problem of the generation of AGW by two auroral electrojets. The dimensions of the region with the most efficient AGW generation by the ponderomotive force and by Joule heating are estimated. Working equations are obtained both for a source that

varies harmonically with time, and for a nonperiodic source that acts in the form of a series of pulses with different amplitude and duration. (6 refs.)

104651 Comparison of decameter-wave propagation times calculated by adiabatic and ray methods. I.B.Yegorov, N.I.Manayenkova, Ye.Ye.Tsedilina (Inst. Terrestrial Magnetism, Ionosphere & Radiowave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.37-40 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
A detailed comparison is made of the adiabatic-invariant and ray methods for calculating the propagation time of short radiowaves in the ionosphere. Some characteristics of the 'error' of the adiabatic method are established. The maximum error of this method is less than 1.5%. (10 refs.)

104652 One type of phase anomaly of VLF signals on auroral routes. G.P.Beloglazova, M.I.Beloglazov (Polar Geophys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.41-3 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
The anomalous phase variations of VLF waves which occur against a quiet geophysical background on Norway-Apatity routes are discussed. The duration of these variations ranges from a few minutes to 0.5 to 1.0 h, and their typical magnitude is 3 to 6 μs. Their most probable cause is shown to be an injection of relativistic electrons. (14 refs.)

104653 Dynamics of the lower ionosphere during auroral disturbances according to VLF data. G.F.Remenets, M.I.Beloglazov (Inst. of Phys., Univ. of Leningrad, Leningrad, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.177-81 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The coefficients for the reflection of the first two ionospheric rays from the 'quiet' auroral ionosphere and during several auroral disturbances are determined from the three-frequency relative variations of VLF signals (10-16 kHz) detected for a source in the intermediate zone. (14 refs.)

104654 Solitary internal gravity wave in the ionospheric F region. F.G.Deminova, M.G.Deminov, L.M.Yerukhimov, O.N.Savina, L.A.Yudovich (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.182-5 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The propagation of a solitary internal gravity wave in the upper atmosphere can be described in the approximation of a weak nonlinearity. An experimental determination of one of the characteristics of a disturbance makes it possible to learn about all the parameters of a solitary internal gravity wave and of its plasma wake. Solitons of this sort may be observed in substorms with an energy discharge $p \gtrsim 10^{18}$ erg/sec in the auroral zone. (12 refs.)

104655 Model for the distribution of the ionospheric electric field caused by the azimuthal component of the interplanetary magnetic field. V.M.Uvarov (Arctic & Antarctic Inst., State Hydrometeorological Committee, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.186-8 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
A model is constructed for the distribution of the electric field caused by the B_y component of the interplanetary magnetic field. The theoretical results agree well with direct measurements at the polar caps and at the cusps. (8 refs.)

104656 Fluctuations in the delay of a short-wave signal during oblique sounding. A.V.Gurevich, E.E.Tsedilina (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.189-91 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The effect of multiple scattering of radio waves in the ionosphere on the mode broadening on oblique-sounding ionograms is analyzed in the adiabatic approximation. A method for determining the effective ray diffusion coefficient has been developed from a study of the model broadening. (9 refs.)

104657 Eddy intrusion of hot plasma into the polar cap and formation of polar-cap arcs. Y.T.Chiu, D.J.Gorney (Space Sci. Lab., Aerospace Corp., Los Angeles, CA, USA).
Geophys. Res. Lett. (USA), vol.10, no.6, p.463-6 (June 1983).
Presents plasma and electric field data obtained by the S3-3 satellite over the polar caps. It is demonstrated that: (1) plasma signatures in the polar cap arc formation region near 5000 km altitude show clear intrusions of plasma sheet (~keV) and magnetosheath (~100 eV) plasma into a background of low-energy polar cap plasma; (2) the combined plasma and electric field signatures (electron inverted-V, ion beam and $\nabla.E<0$) are exactly the same as in the evening discrete arc. This equivalence of polar cap and evening discrete arc signatures is interpreted as indication that their formation processes are identical. The spatial structures of polar cap electric fields and the associated plasma signatures are consistent with the hypothesis that plasma intrusion into the polar cap takes the form of multiple cellular eddies. (16 refs.)

104658 Electrojet boundaries and electron injection boundaries. A.Grafe (Central Inst. for Solar-Terrestrial Phys., Acad. of Sci., Berlin-Adlershof, Germany).
J. Geomagn. & Geoelectr. (Japan), vol.35, no.1, p.1-15 (1983).
From observations of the magnetic field along several magnetometer chains motions of the boundaries of auroral electrojets during the active substorm phase are derived. It turned out that for both electrojets (westward and eastward electrojet) the equatorward boundary is more stable than the poleward one. For both electrojets, however, this boundary correlates quite well with *Kp*. The *Kp* dependence of the equatorward electrojet boundary was compared with that of the electron injection boundary after Kivelson et al. (1980). It turned out that the equatorward boundary of the westward electrojet—but not of the eastward electrojet—coincides quite well with that of the electron injection boundary. (22 refs.)

104659 Global pattern of auroral ion precipitation: a review of the results from the AUREOLE-1 and AUREOLE-2 satellites. J.Crasnier, J.A.Sauvaud, F.Cambou (Centre d'Etude Spatial des Rayonnements, Toulouse Univ., Toulouse, France), V.A.Gladyshev, R.A.Kovrazhkin, Y.I.Galperin.
J. Geophys. (Germany), vol.52, no.3, p.150-7 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
The ion measurements (0.2-30 keV) made on board the AUREOLE-1 and 2 polar orbiting satellites are reviewed in order to construct a synthetic global pattern of the auroral ion precipitation. The more prominant features of the picture obtained are summarized. The global pattern is discussed in the context of the distribution of the various plasma domains in the outer magnetosphere. (42 refs.)

104660 Analysis of some ionospheric parameters of the South Atlantic geomagnetic anomaly by means of VLF waves. A.H.Cardoso (Dept. de Fisica do Setor de Ciencias Exatas, Univ. Federal do Parana, Curitiba, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.229-46 (June 1982). In Portuguese.
The author has characterised a small diurnal variation of the height of the ionospheric 'D' region which is associated with the South Atlantic Geomagnetic Anomaly (SAGA), using VLF waves. The result was achieved with a privileged trajectory by using the diurnal phase variation. The simultaneous use of the experimental data of the diurnal variation of the amplitude and Wait's theory (1981) with usually accepted parametrized values, however, gives results which are physically inconsistent. (16 refs.)

94.30 PHYSICS OF THE MAGNETOSPHERE

(for planets, see 96.30)

104661 Relationship between amplitude of equatorial SC(−+) and electrojet strength. J.Hanumath Sastri (Indian Inst. of Astrophys., Bangalore, India).
Curr. Sci. (India), vol.52, no.9, p.419-20 (5 May 1983).
Storm sudden commencements (SC or SSC) manifest at low and equatorial latitudes most commonly in two forms denoted as SC(+) and SC(−+) or SC*. A fascinating aspect of SC at equatorial latitudes is the conspicuous enhancement of its magnitude during day time in the vicinity of the dip equator. This characteristic feature is observed in the amplitude of both the preliminary reverse impulse (PRI) and main impulse (MI) of SC(−+) and MI of SC(+); the rate of dip equator enhancement is, however, larger for SC(−+) than for SC(+). The origin of the occurrence of SC(−+) with enhanced magnitude at day time dip equator is not yet well understood. A study of the relationship of the amplitude of the constituent components of SC(−+) at the dip equator to the electrojet strength at the time of its occurrence is presented. (16 refs.)

104662 Electrons with energies of hundreds of megaelectron volts in near-Earth space. N.L.Grigorov.
Cosmic Res. (USA), vol.20, no.5, p.498-506 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.705-13 (Sept.-Oct. 1982). [received: June 1983]
The results of measurements of high-energy electron fluxes in the Earth's vicinity at heights of ~200-500 km carried out on the Proton-3 and -4 and Kosmos-490 Earth satellites are discussed. Energy spectra measured under different observing conditions are presented. The experimental data are compared with theoretical calculations. It is shown that the $\pi \rightarrow \mu \rightarrow e$ decay mechanism explains the measurement results well. (15 refs.)

104663 Magnetic field of a plasma flow past a blunt body [Earth magnetosphere]. S.I.Alimarin, B.A.Tverskoy (Inst. of Nuclear Phys., Univ. of Moscow, Moscow, USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.1-3 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
An analytic expression is derived for the magnetic field of a given flow of incompressible plasma past a blunt semi-infinite body similar to the Earth's magnetosphere. Approximate equations are presented for this field far away from the body and near it surface. (9 refs.)

104664 Relationships among the ring current, the precipitated electrons, and the aurora in the morning magnetosphere, from data of the Kosmos-900 satellite. A.V.Dronov, M.I.Panasyuk, E.N.Sosnovets, L.V.Tverskaya, V.I.Tulupov, O.V.Khorosheva (Inst. of Nuclear Phys., Univ. of Moscow, Moscow, USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.64-7 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
Data obtained by Kosmos-900 are used in the analysis of the magnetic storm of 1 to 2 December 1977 ($D_{st} \approx -100_{\gamma}$). Data on the protons of the ring current, the precipitated electrons, and the auroral emission in the line at 3914 Å are reported. (8 refs.)

104665 Simulation of VLF wave propagation in the Earth's magnetosphere. O.A.Molchanov, O.A.Mal'tseva (Inst. of Terrestrial Magnetism, Ionosphere & Radiowave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.72-7 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
A method is proposed for determining the path and amplitude characteristics of VLF waves propagating in the Earth's magnetosphere. The results are used to interpret satellite and ground-based experimental data. (22 refs.)

104666 Whistler trapping near the plasmapause. S.S.Sazhin, S.P.Varshavskiy (Univ. of Leningrad, Leningrad, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.192-5 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
A qualitative analysis of whistler propagation near the plasmapause shows that whistlers propagating at a small angle from the magnetic field are effectively trapped in the region adjacent to the inner edge of the plasmapause.

This type of trapping occurs primarily under moderately disturbed conditions, with $K_p=2$. (9 refs.)

104667 The effect of solar wind parameters of geomagnetic activity. V.G.Vorobyev, V.L.Zverev (Polar Geophys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.217-20 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The effect of solar wind velocity v and polarity of the B_y component on the geomagnetic activity in the aurora zone was studied. It is shown that at any B_z direction, the v increase is followed by an increase in geomagnetic activity. Both at $B_z<0$ and $B_z>0$ substorm intensities are greater during summer at the negative B_y, while during winter they are greater at $B_y>0$. (16 refs.)

104668 Evolution of density inhomogeneities in auroral plasma injected from the plasma sheet. A.P.Kropotkin (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.221-3 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The plasma parameter in the plasma sheet and the particle-ring current is $\beta \gtrsim 1$, so that a flute (interchange) instability may be driven. The evolution of this instability is analyzed, with allowance for effects of the finite ion Larmor radius and the saturation due to nonlinearity. The electric fields of the perturbations and the longitudinal currents are estimated. The results are in accordance with experiment. (11 refs.)

104669 Phase observations of geomagnetic pulsations. M.B.Gokhberg, O.A.Pokhotelov, Yu.G.Khabazin (Inst. of Phys. of Earth, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.224-7 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The azimuthal wave numbers measured for hydrodynamic waves near the equatorial plane of the magnetosphere should differ from the numbers measured for the corresponding waves of geomagnetic pulsations at the Earth's surface. The difference arises because of an azimuthal dependence of the time required for a hydromagnetic perturbation to propagate from the equatorial plane to the Earth's surface. (10 refs.)

104670 Dielectric currents in the low-altitude boundary layer and geomagnetic tail. K.D.Cole (Lab. for Planetary Atmospheres, NASA/Goddard Space Flight Center, Greenbelt, MD, USA).
Geophys. Res. Lett. (USA), vol.10, no.6, p.467-70 (June 1983).
Considers a collisionless plasma with E (the electric field) parallel to the y-axis of a cartesian frame of reference and B (the magnetic induction) parallel to the z-axis. When there is a gradient, orthogonal to B, of the quantity ϵE^2, where $\epsilon=1+4\pi\rho_m c^2/B^2$, where ρ_m is the plasma mass density and c the speed of light, there is driven a (dielectric) current (j) given in the following two cases, by $j=[\nabla(\epsilon E^2)]c/B$. (i) When $\nabla(\epsilon E^2)$ is parallel to E, j is in the direction of $E\times B$, and (ii) and $\nabla(\epsilon E^2)$ is in the direction $E\times B$, j is in the direction of E. In the former case it follows that, in a steady state, $p_\perp+B^2/8\pi-\epsilon E^2/8\pi=\text{constant}$, along a line in the y-direction, and in the latter case $p_\perp+B^2/8\pi+\epsilon E^2/8\pi=\text{constant}$, on a line in the x-direction where $p_\perp$ is the pressure perpendicular to B. The currents related to ϵE^2 are geophysically significant in the region of interaction of the solar wind and geomagnetic field in the low latitude boundary layer and geomagnetic tail. The last written equation enables a realistic estimate of the cross-tail electric field to be made. (12 refs.)

104671 Collisionless dissipation processes in quasi-parallel shocks. K.B.Quest, D.W.Forslund, J.U.Brackbill, K.Lee (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Geophys. Res. Lett. (USA), vol.10, no.6, p.471-4 (June 1983).
The evolution of collisionless, quasi-parallel shocks ($\theta_B dn<45°$, where θ_{Bn} is the angle between the shock normal and the upstream magnetic field), is examined using two dimensional particle simulations. Reflected ions upstream from the shock are observed with average guiding centre velocity and gyrational energy which agree well with the prediction of simple specular reflection. Strong ion heating through the shock ramp is apparently caused by large amplitude whistler turbulence. A flux of suprathermal electrons is also observed upstream with increased flux oblique to the magnetic field direction. Much stronger ion heating occurs in the shock than electron heating. The relevance of this work to the Earth's bow shock is discussed. (16 refs.)

104672 Hall current effect on tearing mode instability. T.Terasawa (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).
Geophys. Res. Lett. (USA), vol.10, no.6, p.475-8 (June 1983).
From a linear 2-D eigenmode analysis, it was found that the Hall current effect on collisional tearing mode instability becomes important for the thin magnetic reversal layer whose width is comparable to the ion inertia length; Hall currents produce a three-dimensional field structure and increase the reconnection (growth) rate. Since the magnetic reversal layer widths both in the magnetopause and in the magnetotail are reported to become as thin as the ion inertial length (several hundred km) when the reconnection process is supposed to occur, the Hall current effect would have an observational significance. The Hall current effect may explain the appearance of the dawn-dusk component of the magnetic field in the magnetotail reconnection region. (17 refs.)

104673 Large-amplitude ion bounce wave in the magnetosphere near L=3. L.J.Lanzerotti, L.V.Medford, A.Hasegawa (Bell Labs., Murray Hill, NJ, USA), D.L.Lin.
Geophys. Res. Lett. (USA), vol.10, no.6, p.479-81 (June 1983).
Large amplitude (~30 nT), high frequency (~0.14 Hz) geomagnetic field oscillations were observed superimposed on lower frequency ones (~0.008 Hz) at L~3 during a large magnetic storm. These are the largest amplitude oscillations ever reported in the Pc2 frequency band (0.1-0.5 Hz). Measurements at two stations spaced in azimuth by ~240 km show the higher frequency waves to occur at the same time at both locations. The higher frequency oscillations, which have larger amplitudes at the station close to local midnight, are consistent with a wave excited by the bounce motion of protons with a peak in the energy distribution at ~100 keV. The longer-period variations, which are highly non-correlated between the two locations, could be evidence of a surface 'wave' on the plasmapause. (21 refs.)

104674 Computer simulation of auroral kilometric radiation. J.S.Wagner (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA), L.C.Lee, C.S.Wu, T.Tajima.
Geophys. Res. Lett. (USA), vol.10, no.6, p.483-6 (June 1983).
Studies the generation of auroral kilometric radiation (AKR) using relativistic, electromagnetic, particle simulations. The AKR source region is modeled by two electron populations in the simulation: a cold (200 eV) Maxwellian component and a hot (5-20 keV) population possessing a loss-cone feature. The loss-cone distribution is found to be unstable to the cyclotron maser instability. The fast extraordinary (X-mode) waves dominate the radiation and saturate when resonant particles diffuse into the loss-cone via turbulent scattering of the particles by the amplitude X-mode radiation. This paper studies the linear amplification and nonlinear saturation of electromagnetic waves associated with two components of electrons which consist of a weakly relativistic population of electrons possessing a loss-cone distribution, and a cold Maxwellian background. The motivation is to understand the mechanism responsible for the production of auroral kilometric radiation. (11 refs.)

104675 Heavy ion plasmas in the outer magnetosphere. D.T.Young (Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Geophys. (Germany), vol.52, no.3, p.167-75 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
Discusses heavy ions (below 30 keV/Q) in magnetospheric plasmas from two points of view: heavy ions as minor species or 'tracers, and heavy ions as major plasma constituents. At present some 12 species of heavy ions have been detected in concentrations ranging from nearly 100% of the total ion density to $<10^{-2}$%. Tracer ions detected thus far include $^4He^{2+}$, O^{2+}, N^+ and N^{2+}; whereas the species O^+ and $^4He^+$ very often appear as major ions. Still other ion species, such as higher charge state solar wind oxygen or ionospheric molecular species, may be present in the high altitude magnetosphere but have not yet been detected. Some discussions of future prospects in this field is included. (40 refs.)

104676 Energetic particle signatures near magnetospheric boundaries. M.Scholer (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Extraterrestrische Phys., Garching, Germany).
J. Geophys. (Germany), vol.52, no.3, p.176-89 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
Two aspects of magnetospheric energetic particles have gained increasing attention in recent years: firstly their signatures, in particular the anisotropy, have been used in order to study the behaviour of magnetospheric boundaries, and secondly the particles themselves have been analyzed in order to determine their acceleration mechanisms. The author presents a review of recent ISEE observations of energetic ions and electrons near the magnetopause and near the boundary of the plasma sheet. (36 refs.)

104677 Recent ISEE observations of the magnetopause and low latitude boundary layer: a review. M.A.Saunders (Blackett Lab., Imperial Coll., London, England).
J. Geophys. (Germany), vol.52, no.3, p.190-8 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
ISEE-1 and 2 satellite observations at the dayside magnetopause have enabled important progress to be made on the solar wind/magnetosphere coupling problem. The ISEE results emphasize the significance of reconnection and indicate that the process can occur both in a quasi-steady form in an unsteady (flux transfer event (FTE)) manner. The detection of FTEs on open field lines within the magnetosphere, the discovery of reverse polarity FTEs, and the observation that FTEs can be associated closely with intervals of quasi-steady reconnection flow, all support further the view that FTEs are reconnection phenomena. Indeed, a sharp distinction need not exist between FTEs and the type of reconnection event described as quasi-steady. (39 refs.)

104678 Motion of flux transfer events on 10 November 1977 determined by energetic particles in ISEE 2. P.W.Daly, E.Keppler (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany).
J. Geophys. (Germany), vol.52, no.3, p.199-202 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
The medium energy particle spectrometer on board ISEE 2 has been used to measure the orientation and motion of the flux transfer events (FTEs) seen at the inbound magnetopause crossing on 10 November 1977. The method used is a simple version of the remote sensing technique using azimuthal asymmetries of ion intensities, that has previously been used to sound the magnetopause. During these events, the particle intensity was high enough that the secondary detectors, looking out of the ecliptic plane, could also be used. The FTEs instructions are consistent with the picture of FTEs as isolated flux tubes in the magnetosheath connected to the magnetosphere which then move poleward to release magnetic tension. (18 refs.)

104679 On the dynamics of the ring current. B.Hultqvist (Kiruna Geophys. Inst., Kiruna, Sweden).
J. Geophys. (Germany), vol.52, no.3, p.203-14 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
The present knowledge of the ring-current population is briefly summarized, with emphasis on the lower energies. It is shown that in the February 1979 magnetic storm, O^+ ions of ≤17 KeV energy contributed considerably to the energy density of the ring current in its entire altitude range. They probably dominated by dayside ring current, from an energy density point of view, in the early phase of the storm. It is argued that these O^+ ions, observed in the dayside magnetosphere in the early phase of the storm, were extracted directly from the dayside ionosphere over a wide latitude interval. The likely importance, from an energy density point of view, of O^+ ions in the ring current at higher energies (>17 keV) where the composition has not, as yet, been investigated, is discussed. (47 refs.)

104680 Ionic composition of the Earth's radiation belts. W.N.Spjeldvik (Cooperative Inst. of Res. in Environmental Sci., Univ. of Colorado, Boulder, CO, USA).
J. Geophys. (Germany), vol.52, no.3, p.215-38 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
Several different ion species have been positively identified in the Earth's radiation belts. European, American and Soviet Space experimenters have reported ion composition measurements over wide ranges of energies: at tens of keV (ring-current energies) and below, and at hundreds of KeV and above. Three is still a gap in the energy coverage from several tens to several hundreds of keV where little observational data are available. Emphasis is placed on the radiation belt ionic structure above 100 keV. Both quiet time conditions and geomagnetic storm periods are considered. (133 refs.)

104681 Energy and charge distribution of energetic helium ions in the outer radiation belt of the Earth. B.Klecker, D.Hovestadt, M.Scholer (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Extraterrestrische Phys., Garching, Germany).
J. Geophys. (Germany), vol.52, no.3, p.239-46 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
Reports the first direct determination of the charge states of energetic helium ions in the outer radiation belt. The measurements, in the range $L=3$-4, revealed unexpected high fluxes of singly ionized helium below 1 MeV/nucleon. The data were obtained with the MPE/UoMd experiment aboard the ISEE-1 spacecraft during a near equator ($iB/B_0<1.025$) perigee pass on 17 Nov 1977. The observations suggest that fast cross-L transport during magnetic storms and non-adiabatic motion may play an important role

for the distribution of helium ions at MeV energies in the outer radiation belt. (30 refs.)

104682 High energy electrons at altitudes 500 km near the equator. L.Just, K.Kudela (Inst. of Experimental Phys., Slovak Acad. of Sci., Kosice, Czechoslovakia), A.A.Gusev, G.I.Pugacheva.
J. Geophys. (Germany), vol.52, no.3, p.247-50 (1983). (European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere, Leeds, England, 23-27 Aug. 1982).
Measurements provided by a high-energy electron spectrometer on board a low altitude polar orbiting satellite allowed the determination of fluxes of electrons with energy above 100 MeV which were stably trapped or quasi-trapped in the radiation belt at L-1.13-1.16. Relatively high fluxes of trapped electrons at minimum-B-equator are reported. The shape of the pitch angle distribution, together with the relatively high fluxes of electrons, supports the assumption that they are generated due to the decay of particles produced in interaction of high energy protons trapped in the inner radiation belt with the residual atmosphere. 94.40E Interplanetary propagation and effects

104684 Cosmic-ray anistropy in interplanetary space. L.I.Dorman, M.E.Katz, Yu.I.Fedorov.
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.97-126 (June 1983).
The kinetic equation describing cosmic-ray propagation in interplanetary space has been used to construct a consistent theory of cosmic-ray anisotropy including the second spherical harmonic of particle angular distribution. The amplitude and phase of semi-diurnal cosmic-ray variation have been calculated. Expressions describing the relationships of the semi-diurnal variation parameters to helio-latitude distribution of cosmic rays have been derived. The results obtained are compared with observational data. (50 refs.)

104685 Study of the fluxes of electrons with E_e=40-500 keV in quiet periods of solar activity by the methods of correlation and spectral analysis. M.A.Zel'dovich, G.A.Trebukhovskaya.
Cosmic Res. (USA), vol.20, no.5, p.494-8 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.700-4 (Sept.-Oct. 1982). [received: June 1983]
Considers the background fluxes of low energy electrons (E_e=40-500 keV) which are observed in interplanetary space at times when there are no solar cosmic rays from flares. The data were obtained by the Prognoz-3 satellite in the years 1973-1974. The authors calculate the fluctuation power spectra and correlation functions of simultaneous series of fluxes of these electrons, galactic cosmic rays, and also certain parameters which characterize solar activity and the condition of the interplanetary medium. This analysis indicates that the background fluxes of low energy electrons are possibly solar in origin, but they are not from flares. (6 refs.)

104686 Coefficient of diffusion of galactic cosmic rays in interplanetary space. V.Kh.Babayan (Inst. of Terrestrial Magnetism, Ionosphere, & Radio Wave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.11-13 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
An analytic expression is derived for the dependence of the diffusion of galactic cosmic rays on the heliocentric distance, assuming that the solar wind velocity depends on distance and transforming the Fokker-Planck equation to a differential equation for the diffusion coefficient. (6 refs.)

104687 Second harmonic of the cosmic-ray distribution function for the case of a strong magnetic field. L.L.Kichatinov, Yu.G.Matyukhin (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.168-70 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
A drift kinetic equation is derived which incorporates multiple scattering of particles by random inhomogeneities of the interplanetary magnetic field. A transport equation and the first and second spherical harmonics of the particle distribution function are derived for the case of a strong magnetic field. The relationships between the current, the density, and the second harmonic of the particles on the one hand and current, density, and second harmonic of the Larmor circles on the other are found. (6 refs.)

94.40H Energetic solar particles and photons

104688 Determination of the proton spectral index from data on solar microwave bursts. I.V.Chertok (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.159-62 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
A method is developed for using data on solar radio bursts to make short-term predictions of the energy-spectrum index γ of the fluxes of protons with energies on the order of 10 MeV near the Earth. The ratio of the maximum intensities of the solar radio bursts at the frequencies 9 and 15.4 GHz (S_9/S_{15}) is used. The relationship between S_9/S_{15} and γ is determined for radio bursts on the western half of the solar disk from data on 35 proton events. A heliolongitude correction for protons arriving at the Earth from bursts on the eastern half has also been determined. (13 refs.)

104689 Characteristics of solar-flare proton fluxes in the auroral oval at various magnetospheric disturbance levels. N.A.Nikirova, N.K.Pereyaslova (Inst. of Appl. Geophys., State Committee on Hydrometeorology, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.163-7 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The spatial distributions of the fluxes of protons with energies $Ep>5$ and >90 MeV in the high-latitude magnetosphere have been studied for the period 1969-1978. The temporal and spectral characteristics of the solar cosmic rays in the auroral oval have been determined as functions of the local time, the anisotropy of the solar cosmic rays, and the geomagnetic disturbance level. (4 refs.)

Interaction of solar neutrinos with the cosmic background ....See Entry 104827

94.40K Solar modulation and geophysical effects

104690 A possible scheme for an eleven-year modulation cycle of cosmic rays in light of the latest radio-astronomical data. V.I.Shishov, V.I.Vlasov, I.V.Chashey (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.7-10 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
It is shown that one can determine the distribution of the diffusion coefficient of cosmic rays (including the distribution at high heliolatitudes) at distances $R\leq1$ AU, from radio-astronomical data on the turbulence of the interplanetary plasma. Results of radioastronomical observations are presented. It is concluded that the eleven-year modulation cycle of the cosmic-ray flux is due to the effect of the high heliolatitudes. (10 refs.)

104691 Emission of high-energy albedo particles from the atmosphere into outer space. N.L.Grigorov (Inst. of Nuclear Phys., Univ. of Moscow, Moscow, USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.171-6 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The particle motion in a dipole magnetic field in the vicinity of the particle production point in the upper atmosphere is analyzed. The initial conditions of the motion (the pitch angle and the geomagnetic coordinates of the starting point) are varied. Approximate expressions are derived for the amount of material which is traversed by the particle between the starting point and and the top of the atmosphere in the course of its emission into outer space. (8 refs.)

104692 Periodicity of about 13 days in the cosmic-ray intensity in the solar cycles no.18, 19 and 20. O.Filisetti, V.Mussino (Istituto di Fisica Sperimentale, Politecnico di Torino, Torino, Italy).
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.599-610 (Dec. 1982).
The quasi-periodical variations of the cosmic-ray intensity, with a period of about 13 days, have been studied in the data recorded through shielded ionization chambers at Huancayo and at Cheltenham-Fredericksburg during the solar cycles no.18, 19 and 20 (1944-74). The temporal variation of the annual average amplitudes of the oscillation of about 13 days for both stations is compared with the behaviour of the Wolf number R of sunspot. For the cycles no.18 and 19, these amplitudes present, like 27-day oscillations, two maxima, while for the cycle no.20 there is only one clear maximum. The negative correlation between the annual mean cosmic-ray intensity and the amplitude of the 13-day oscillation is also presented. (9 refs.)

Characteristics of solar-flare proton fluxes in the auroral oval at various magnetospheric disturbance levels ....See Entry 104689

94.40L Composition and energy spectra

104693 Particle acceleration during the development of a tearing instability. L.M.Zelenyi, A.S.Lipatov, A.L.Taktakishvili.
Cosmic Res. (USA), vol.20, no.5, p.506-15 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.714-24 (Sept.-Oct. 1982). [received: June 1983]
The energy spectrum of particles accelerated in the vicinity of the X-point of the magnetic field during the development of a tearing instability in a current sheet is investigated. The dynamics of the spectrum in the linear and nonlinear stages of development of the instability is studied. Allowance is made for the contribution to the energy spectrum of particles flowing into the vicinity of the X-point of the magnetic field owing to drift in crossed electric and magnetic fields; the dynamics of particle acceleration is modeled numerically and the calculated results are compared with the theoretical model. (7 refs.)

104694 A search for superheavy nuclei tracks in extraterrestrial olivine crystals. J.S.Yadav (Tata Inst. of Fundamental Res., Bombay, India), A.P.Sharma, G.N.Flerov, V.P.Perelygin, S.G.Stetsenko, P.Pellas, C.Perron, R.Antanasijevich, B.Jakupi, Y.Topdorovich.
Pramana (India), vol.20, no.4, p.287-92 (April 1983).
A study is made for the search of superheavy nuclei in Marjalahti, Eagle Station and in other pallasite olivines. The olivine crystals are calibrated for heavy ion track lengths by using heavy ion beams from cyclotrons. The calibration for ultra heavy ions which are presently not available with sufficient energy to produce volume tracks in olivine crystals, is based on Katz and Kobetich (1968) model of track formation. The length spectrum of volume tracks, revealed by puncturing them with focused Nd-glass laser beam, is measured and the abundances of different nuclei groups are calculated. During the scanning 4 cm^3 olivine crystals, about 360 long tracks of uranium group as well as two very long tracks have been found. If these tracks belong to superheavy nuclei, the relative abundance of super heavies is found to be 6×10^{-11} in galactic cosmic rays. (14 refs.)

104695 Spectral observations of atmospheric γ-ray background. U.B.Jayanthi, F.G.Blanco, O.D.De Aguiar, J.O.D.Jardim, J.L.Benson, I.M.Martin, K.R.Rao (Inst. de Pesquisa Espaciais, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.3, p.431-42 (Sept. 1982).
Based on the results of two balloon flights, made at Sao Jose dos Campos and at Juazeiro do Norte in Brazil, using omnidirectional gamma ray detectors, the different aspects of atmospheric gamma rays at equatorial latitudes in the energy interval of 0.3 to 4.5 MeV are investigated. The energy loss spectrum in this energy band consists of a continuum and a photopeak at 0.51 MeV in agreement with previous observations. A discussion of the spectral nature of this background and the observed lower intensities of both the continuum and the 0.51 MeV line with reference to observations at other latitudes is presented. (14 refs.)

104696 Low energy gamma ray enhancement observed during a stratospheric balloon flight. K.R.Rao, I.M.Martin, J.O.D.Jardim, U.B.Jayanthi (Inst. de Pesquisas Espciais, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.3, p.501-15 (Sept. 1982).
An omnidirectional gamma ray detector was flown on a stratospheric balloon on December 15, 1978 from Sao Jose dos Campos, Brazil. After reaching ceiling, an increase in the count rate was observed. After considering the probable sources causing this increase, it is suggested that this increase might be due to the supernova, first observed optically in May 1978 in galaxy MCG-4-32-23. The energy spectrum of this supernova shows a flattening of slope above 1.5 MeV. (42 refs.)

104697 Some recent developments in the study of the elements and isotopes of the cosmic radiation. D.O'Sullivan (Dublin Inst. for Advanced Studies, Dublin, Ireland).
Vistas Astron. (GB), vol.26, pt.2, p.87-105 (1982).
Studies of the charge, mass and energy spectra of cosmic ray nuclei have benefited greatly from advances in detector technology and the availability of high altitude balloons and Earth orbiting satellites. The relative abundances of these nuclear particles are useful indicators of the nuclear reactions that take place at the source and provide information on interstellar propagation processes. Several experiments carried out since the late nineteen seventies have provided some new insights into their composition, age and origin. However, many uncertainties are still unresolved. (87 refs.)

104698 Coherent interaction of galactic neutrinos with material targets. P.F.Smith, J.D.Lewin (Rutherford Appleton Lab., Didcot, England).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.185-90 (28 July 1983).
The authors obtain expressions for the first and second order forces arising from the coherent interaction of galactic neutrinos with finite-thickness material targets. For any geometry, a uniform flux gives only a second order force, of typical magnitude 10^{-23} dyn/g, but artificially-produced neutrino density gradients could, in principle, add a significant first order contribution. Some preliminary comments on future detection feasibility are included. (25 refs.)

104699 Quasistationary electromagnetic field in the solar wind. I.I.Alekseyev, I.S.Veselovskiy, A.P.Kropotkin (Inst. of Nuclear Phys., Univ. of Moscow, Moscow, USSR).
Geomagn. & Aeron. (USA), vol.22, no.1, p.4-6 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1 (1982).
Parker's kinematic model with ideal conductivity is improved. It is shown that, in general, none of the three components of the nonstationary and stationary interplanetary magnetic field $\mathbf{B}(B_r, N_\theta, B_\phi)$ vanish. (7 refs.)

104700 Study of the statistical properties of the relationship between the interplanetary and geomagnetic fields by means of multiple-coherence functions. L.B.Volkomirskaya, A.N.Zaytsev, S.V.Panfilov (Inst. of Terrestrial Magnetism, Ionosphere & Radiowave Propagation, Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.1 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.1, p.68-71 (1982).
Some intervals in which the relationship is most stable are identified. The effect of a reversal of the azimuthal component of the interplanetary field on the correlation spectrum is evaluated. (10 refs.)

104701 Scintillation dispersion analysis for an extended medium. N.A.Lotova, I.V.Chashey (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Geomagn. & Aeron. (USA), vol.22, no.2, p.155-8 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.2 (1982).
The effect of the depth of the medium on the dispersion relation for interplanetary scintillations is studied. Two models for the motion of the medium are considered: a spherically symmetric solar wind and a fast stream superimposed on a spherically symmetric wind. The high-frequency part of the dispersion relation is determined primarily by the velocities in the parts of the medium close to the observer. (9 refs.)

104702 Orbit determination program, application to Earth observation satellite. M.Grimard, A.M.Mainguy (ONERA, Catillon, France).
Acta Astronaut. (GB), vol.10, no.3, p.117-24 (March 1983). In French.
Presents an orbit determination program based on two algorithms: Kalman filtering and Rauch smoothing. Novel adaptation of these algorithms allows one to obtain a posteriori statistical estimations of evolution and measurement noises and their standard deviation. Analysis of results about these noise estimations allows one to regulate optimally the a priori levels of noise standard deviations and detect eventually model errors. An application is presented for Earth observation satellites, at first with simulated data, then with real data (TIROS N satellite). (7 refs.)

95.10C Celestial mechanics

(for dynamics and kinematics of stellar systems, see 98.10)

104707 Stability and integrability in the planar general three-body problem. T.-Y.Huang, K.A.Innanen (Dept. of Phys., York Univ., Toronto, Ontario, Canada).
Astron. J. (USA), vol.88, no.7, p.1064-73 (July 1983).
The Kolmogorov entropy is applied to discuss the stability and integrability of the planar general three-body problem with equal masses. The numerical experiments show that the entropy is a useful and sensitive tool to investigate the stability problem. Stability boundaries for initial semimajor axis are given for different values of initial eccentricities, and are compared with those in Hill stability. In particular, the evolution of the elements and the difference between direct and retrograde orbits are explored. The integrability of this system is also discussed. The authors argue that there exist local additional integrals when the initial elements are situated inside the stable region, or far outside the stability boundary. The reliability of the check of numerical accuracy by use of the energy integral is examined. The authors find that this check is unreliable when the initial elements are close to the stability boundary. (29 refs.)

104708 Expansion theory for the elliptic motion of arbitrary eccentricity and semi-major axis. V. Elliptic expansions in terms of the sectorial variables for the first four categories. M.Adel Sharaf (Dept. of Astron., Univ. of Cairo, Cairo, Egypt).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.377-401 (June 1983).
For pt.IV see ibid., vol.84, no.1, p.73-87 (1982). Elliptic expansions in terms of the sectorial variables $\theta_j^{(i)}$ introduced in Sharaf (1982) to regularise highly oscillating perturbation force of some orbital systems are explored for the first four categories. For each of the elliptic expansions belonging to a category, literal analytical expressions for the coefficients of its trigonometric series representation are established. Moreover, some recurrence formulae satisfied by these coefficients are also established to facilitate their computations, numerical results are included to provide test examples for constructing computational algorithms. (2 refs.)

104709 Periodic solutions of the restricted problem that are analytic continuations of periodic solutions of Hill's problem for small $\mu>0$. L.M.Perko (Dept. of Math., Northern Arizona Univ., Flagstaff, AZ, USA).
Celestial Mech. (Netherlands), vol.30, no.2, p.115-32 (June 1983).
Establishes the existence and first order perturbation approximation of an infinite number of one-parameter families of symmetric periodic solutions of the restricted three body problem that are analytic continuations of symmetric periodic solutions of Hill's problem for small values of the mass ratio $\mu>0$. (20 refs.)

104710 Rotational dynamics with geometric algebra. D.Hestenes (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Celestial Mech. (Netherlands), vol.30, no.2, p.133-49 (June 1983).
A new spinor formulation of rotational dynamics is developed. A general theorem is established reducing the theory of the symmetric top to that of the spherical top. The classical problems of Lagrange and Poinsot are treated in detail, along with a modern application to the theory of magnetic resonance. (7 refs.)

104711 Celestial mechanics with geometric algebra. D.Hestenes (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Celestial Mech. (Netherlands), vol.30, no.2, p.151-70 (June 1983).
Geometric algebra is introduced as a general tool for celestial mechanics. A general method for handling finite rotations and rotational kinematics is presented. The constants of Kepler motion are derived and manipulated in a new way. A new spinor formulation of perturbation theory is developed. (13 refs.)

104712 Geometry of spinor regularization. D.Hestenes (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), P.Lounesto.
Celestial Mech. (Netherlands), vol.30, no.2, p.171-9 (June 1983).
The Kustaanheimo (1964) theory of spinor regularization is given a new formulation in terms of geometric algebra. The Kustaanheimo-Stiefel (1965) matrix and its subsidiary condition are put in a spinor form directly related to the geometry of the orbit in physical space. A physically significant alternative to the KS subsidiary condition is discussed. Derivations are carried out without using coordinates. (8 refs.)

104713 Elimination of the nodes in problems of n bodies. A.Deprit (NBS, Washington, DC, USA).
Celestial Mech. (Netherlands), vol.30, no.2, p.181-95 (June 1983).
In application of the reduction theorem to the general problem of n (≥ 3) bodies, a Mathieu canonical transformation is proposed whereby the new variables separate naturally into (i) a coordinate system on any reduced manifold of constant angular momentum, and (ii) a quadruple made of a pair of ignorable longitudes together with their conjugate momenta. The reduction is built from a binary tree of kinetic frames. Explicit transformation formula are obtained by induction from the top of the tree down to its root at the variable frame; they are based on the unit quaternions which represent the finite rotations mapping one vector base onto another in the chain of kinetic frames. (12 refs.)

104714 A second fundamental model for resonance. J.Henrard, A.Lemaitre (Dept. of Math., Facultes Univ. N.D. de la Paix a Namur, Namur, Belgium).
Celestial Mech. (Netherlands), vol.30, no.2, p.197-218 (June 1983).
Analyses a simple one degree of freedom Hamiltonian system depending upon a parameter $H=-3(\delta+1)R+R^2-2\sqrt{2R}\cos r$. This model is much closer to resonance problems arising in celestial mechanics than the pendulum. The authors deduce from it the conditions of capture into resonance or escape from resonance for systems drifting slowly. The authors apply this analysis to the Enceladus-Dione resonance. (20 refs.)

104715 Collisions in self-gravitating clouds of planetesimals. K.A.Hameen-Anttila (Dept. of Astron., Univ. of Oulu, Oulu, Finland).
Moon & Planets (Netherlands), vol.28, no.3, p.267-303 (June 1983).
A theory of partially elastic collisions is constructed for frictionless planetesimals in an arbitrary gravitational field. The non-zero size of the particles and the influence of gravitational encounters are included. The equations for a self-gravitating rotationally symmetric disk or ring are written in an explicit form. Such systems turn out to be bimodal in the same sense as the Keplerian systems, i.e. there are two kinds of stable configurations which may co-exist in adjacent regions without disturbing the mechanical equilibrium. (22 refs.)

104716 Dirichlet-Weierstrass-Poincare problem. S.Kasperczuk (Katedra Fizyki, Politech. Swietokrzyskiej, Kielce, Poland).
Postepy Astron. (Poland), vol.31, no.1, p.35-43 (Jan.-March 1983). In Polish.
The theory of dynamical systems descends from celestial mechanics and H. Poincare, one of the most outstanding mathematicians, is considered as its creator. One of the most important problems for the progress of the theory of dynamical systems is discussed. The attempts at solving the problem have lead to the rise of two branches of the theory: ergodic theory and KAM-theory. (4 refs.)

104717 Some mechanical invariants of elliptical orbits. Yu.K.Gulak (V.G. Korolenko Pedagogical Inst., Poltavsk, USSR).
Sol. Syst. Res. (USA), vol.16, no.4, p.198-203 (Oct.-Dec. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.4, p.247-51 (Oct.-Dec. 1982).
Some mechanical invariants of transformations of elliptical orbits, which reveal some properties of the motion about an attracting center, are obtained on the basis of the energy integral of the two-body problem. It is shown that Kepler's third law and the virial theorem are contained harmoniously in the final equalities. (2 refs.)

104718 On the periodic orbits of the Contopoulos Hamiltonian. M.Grau (Facultat de Matematiques, Univ. de Barcelona, Barcelona, Spain), J.Llibre, R.M.Ros.
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.284-6
Looking for a third integral in the motion of a particle in a galactic potential with cylindrical symmetry, Contopoulos was led to the Hamiltonian $H(x,y)={}^1/_2(y_1{}^2+y_2{}^2)+{}^1/_2(x_1{}^2+x_2{}^2)-x_1x_2{}^2$, where the position is given by $x=(x_1,x_2)$ and the momentum by $y=(y_1,y_2)$. The Hamiltonian system x_H is $\dot{x}_1=y_1$, $\dot{x}_2=y_2$, $\dot{y}_1=-x_1+x_2{}^2$, $\dot{y}_2=-x_2+2x_1x_2$. This system has the origin $Q_1(0,0,0,0)$ as a critical point at energy level $h=0$ with repeated eigenvalues $\pm i$, and two additional critical points $Q_2=(2^{-1},-2^{-1/2},0,0)$ and $Q_3=(2^{-1},2^{-1/2},0,0)$ at energy level $h=1/8$ with eigenvalues ± 1 and $\pm 2^{1/2}i$. The authors survey and state results on the simple periodic orbits of x_H which start in their critical points. (11 refs.)

95.30 FUNDAMENTAL ASPECTS OF ASTROPHYSICS

104719 Emission mechanism of extragalactic X-ray and radio sources. V.Krishan (Indian Inst. of Astrophys., Bangalore, India).
Astrophys. Lett. (GB), vol.23, no.3, p.133-8 (1983).
The processes of stimulated Raman scattering (SRS) and stimulated Compton scattering (SCS) are investigated in order to provide a possible emission

mechanism for the extragalactic X-rays and radio sources. The system proposed is a relativistic plasma beam propagating transverse to a static periodic magnetic field. The role of the incident pump radiation is replaced by the static spatially periodic magnetic field. It is shown that by varying the spatial periodicity of the magnetic field, one could generate X-rays to radio waves by a single mechanism of SRS and/or SCS. (28 refs.)

104720 Self-similar propagation of axisymmetric radiative magnetogasdynamic shocks with increasing energy. II. J.B.Singh (Dept. of Math., SGR Postgraduate Coll., Jaunpur, India).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.15-23 (June 1983).
Self-similar solutions have been investigated for the propagation of axisymmetric radiative gasdynamic shocks caused by an explosion into an inhomogeneous ideal gas permeated by a current free azimuthal magnetic field. The effects of radiation flux and magnetic field together have been seen in the region of interest on the other flow variables. The total energy of the flow between the inner expanding surface and the shock is taken to be dependent on shock radius obeying a power law. The radiative pressure and energy have been neglected. (9 refs.)

104721 Charged particle motion on and off the equatorial plane of a magnetic star in Rosen's bimetric gravity. A.R.Prasanna (Phys. Res. Lab., Navrangpura, Ahmedabad, India), V.M.Raval.
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.25-36 (June 1983).
Studies in detail (numerically) the trajectories of charged particles in a magnetic field (dipolar at infinity) associated with a static star in the framework of Rosen's bimetric theory of gravity. Potential wells that allow possible trapping of particles in stable orbits are shown to exist both on and off the equatorial plane. (3 refs.)

104722 Radiation spectrum of optically thin relativistic electron-positron plasma. F.A.Aharonian, A.M.Atoyan, R.A.Sunyaev (Yerevan Phys. Inst., Yerevan, Armenia, USSR).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.229-45 (June 1983).
The annihilation spectrum of isotropically distributed monoenergetic electrons and positrons is analysed. For the annihilation spectrum of Maxwellian electron-positron plasma the convenient analytical expressions in the case of relativistic as well as nonrelativistic temperatures are obtained. A comparison of the results with those based on up-to-date numerical investigations is carried out. (22 refs.)

104723 Self-similar flows behind cylindrical shock waves in magnetogasdynamics. J.B.Singh, P.R.Vishwakarma (Dept. of Maths., SGR Postgraduate Coll., Dobhi, Jaunpur, India).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.423-9 (June 1983).
A comparative study has been made between the effects of transverse and axial components of the magnetic field on the self-similar flow variables of the field behind the cylindrical shock waves propagating into a nonuniform atmosphere at rest. The total energy of the wave is constant. (4 refs.)

104724 Discovery of s-process Nd in Allende residue. D.D.Clayton (Dept. of Space Phys. & Astron., Rice Univ., Houston, TX, USA).
Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L107-9 (15 Aug. 1983).
New interpretation is given to the isotopic anomalies detected by Lugmair et al. (1983) in an acid-resistant residue of the Allende meteorite. If the ^{142}Nd excess is due to ^{146}Sm decay, as the discoverers proposed, the decay has probably occurred in interstellar grains, so that the conclusion that ^{146}Sm (1.03×10^8 yr) was alive in the solar system is premature. It is shown that the discovery is likely to be *s*-process Nd, confirming the survival of red-giant stardust in carbonaceous interstellar dust. (15 refs.)

104725 Line radiation from a hot, optically thin plasma: collision strengths and emissivities. T.J.Gaetz, E.E.Salpeter (Center for Radiophys. & Space Res., Cornell Univ., Ithaca, NY, USA).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.2, p.155-68 (June 1983).
Theoretical and experimental data for collision strengths of the strongest multiplets between 1 and 3000 Å in a hot, optically thin plasma are presented. The elements included are H, He, C, N, O, Ne, Mg, Si, S and Fe. Simple power-law fits, as a function of gas-kinetic electron temperature, are provided for the collision strengths of the strongest multiplets for temperatures between 4×10^4 and 10^8K. These collision strengths are used to calculate the multiplet emissivities for a plasma in steady-state collisional ionization equilibrium. The total steady-state emissivity (including continuum) and the emissivities in selected energy bins are also presented. (91 refs.)

104726 On determining magnetohydrodynamic shock parameters θ_{Bn} and M_A. J.K.Chao (Nat. Central Univ., Chungli, Taiwan), K.C.Hsieh.
Bull. Geophys. (Taiwan), no.24, p.93-100 (March 1983).
In a collisionless plasma, the shock structures, the associated waves and turbulence depend strongly on the shock parameters θ_{Bn} and M_A where θ_{Bn} is the angle between the upstream magnetic field and the shock normal and M_A is the upstream Alfven Mach-number. A method is given to determine θ_{Bn} and M_A and their estimated errors for all types of shocks without knowing the shock normals. The only measured quantity needed to determine θ_{Bn} and M_A are the plasma density and magnetic field on both sides of the shock. Its simplicity and ability to handle quasi-parallel shocks as well as quasi-perpendicular and oblique shocks are illustrated. This method should be useful for studying MHD shocks found in space. (20 refs.)

104727 Paradigm transition in cosmic plasma physics. H.Alfven (Dept. of Electrical Engng. & Computer Sci., Univ. of California, San Diego, La Jolla, CA, USA).
Geophys. Res. Lett. (USA), vol.10, no.6, p.487-8 (June 1983).
During the 1970s in situ measurements in the magnetospheres, including the solar wind region ('solar magnetosphere') drastically changed our understanding of the properties of cosmic plasmas. Further, it has been learned how to generalize results from plasma investigations in one region to other regions. This means that laboratory investigations of plasmas of the size of, say, 10 cm can be used to achieve better understanding of cosmic plasmas of magnetospheric dimensions; say, 10^{10} cm. By another step of 10^9 laboratory and magnetospheric results can be transferred to galactic plasmas of, say, 10^{19} cm. A third jump of 10^9 leads to the Hubble distance 10^{28} cm and hence to cosmological problems. (7 refs.)

104728 ^{25}Mg(α,n)^{28}Si and ^{26}Mg(α,n)^{29}Si as neutron sources in explosive neon burning. M.R.Anderson, L.W.Mitchell, M.E.Sevior, D.G.Sargood (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia).
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.170-8 (22 Aug. 1983).
The yields of neutrons from the reaction ^{25}Mg(α,n)^{28}Si and of γ-rays from the reaction ^{25}Mg(α,nγ)^{28}Si have been measured as a function of bombarding energy over the range 1.8-6.3 MeV, and the yield of neutron from ^{26}Mg(α,n)^{29}Si has been measured over the range 1.8-6.0 MeV. Cross sections for ^{25,26}Mg(α,n)^{28,29}Si were extracted from the data and compared with global statistical-model calculations. Thermonuclear reaction rates under stellar conditions appropriate for explosive neon burning are calculated and their significance for the nucleosynthesis of rare neutron-rich nuclei is discussed. (21 refs.)

104729 Neutrino astrophysics and the rest mass of the neutrino. T.Kirsten (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
Phys. Bl. (Germany), vol.39, no.7, p.233-8 (July 1983). In German.
There is a possibility that neutrinos are the dominant form of matter in the Universe. While there is no definite experimental evidence for a rest mass of the neutrino which is not zero, present theories allow for a rest mass of ≤ 6 eV. In the 1 MeV region the interaction cross-section of the neutrino with matter is only 10^{-44} cm^2. It increases fast with the energy of the neutrino and is of the order of 10^{-36} cm^2 at 100 GeV. In spite of the high flux of 10^{13}/cm^2 s, low energy neutrinos cannot be detected experimentally. There are, however, speculations based on a neutrino impulse transfer on gravity wave antennae by coherent scattering which are of cosmological interest. (12 refs.) *R.S.*

104730 Nuclei with an extra quark, stellar burning, and the solar neutrino problem. R.N.Boyd, R.E.Turner, M.Wiescher, L.Rybarcyk (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.609-12 (15 Aug. 1983).
Possible modes of nucleosynthesis involving nuclei with an extra quark have been considered. It is found that such nuclei can contribute significantly to stellar burning even at an abundance level of less than 1 nucleus with an extra quark in 10^{15} nuclei. Consideration of the beta-decay properties of nuclei with an extra quark also suggests that their contribution could solve the solar neutrino problem. (19 refs.)

104731 Nonlinear interaction of magnetogravity waves with Alfven and sound waves. S.Hinata (Dept. of Phys., Auburn Univ., Auburn, AL, USA).
Plasma Phys. (GB), vol.25, no.8, p.883-9 (Aug. 1983).
The convection motions generate magnetogravity, Alfven, and sound waves in the late type stars. They may play an important role in the atmospheric heating, and the interior structure through chemical mixing. Because of this potential importance, the author derives the nonlinear wave kinetic equation for three wave coupling. (11 refs.)

104732 Magnetic fields in the cosmos. E.N.Parker (Univ. of Chicago, Chicago, IL, USA).
Sci. Am. (USA), vol.249, no.2, p.36-46 (Aug. 1983).
The dynamo mechanism for the generation of magnetic fields explains why Venus has no field, why the Sun has an oscillating field and why the dominant galactic field is parallel to the plane of the galactic disk. (no refs.)

104733 Oscillations of a spin in a circular orbit in the Schwarzschild and Lense-Thirring metrics. O.B.Karpov (Moscow Inst. of Chem. Engng., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1034-7 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.68-70 (Nov. 1982).
A gyroscope in motion along a circular geodesic line oscillates with respect to a reference body because of the variability of the inclination of its orbit. Due to precession of the spin vector, these oscillations have the appearance of beats whose frequency is close to that of the orbital motion, and whose amplitude changes with a large period, so that the amplitude increases linearly during a long time. This phenomenon can be detected using symmetrical oscillations of gyroscopes with opposite spin vectors in an orbit around the Earth, or by observing the evolution of a planet orbit in the solar system. (6 refs.)

104734 Astrophysics, cosmology and high energy physics. M.J.Rees (Inst. of Astron., Cambridge Univ., Cambridge, England).
Proceedings of the 1982 CERN School of Physics (CERN 83-05), Cambridge, England, 5-18 June 1982 (Geneva, Switzerland: CERN 1983), p.281-300
A brief survey is given of some topics in astrophysics and cosmology, with special emphasis on the inter-relation between the properties of the early Universe and recent ideas in high energy physics, and on simple order-of-magnitude arguments showing how the scales and dimensions of cosmic phenomena are related to basic physical constants. 95.55 ASTRONOMICAL INSTRUMENTS

104735 A pulse-compensation radio spectrometer. V.G.Grachev, N.F.Ryzhkov.
Bull. Spec. Astrophys. Obs.-North Caucasus (USA), vol.13, p.34-40 (1981). Translation of: *Astrofiz. Issled.-Izv. Spets. Astrofiz. Obs. (USSR)*, vol.13, p.43-51 (1981).
Experimental studies have been performed on the pulse-compensation method of Grachev and Ryzhkov (1980) with one of the radio spectrometers in the RATAN 600 as specially modified to increase the flexibility. Under the new conditions, the device is operated by periodic gating of the analyzer input in combination with pulse compensation of the signals at the output of the square-law detectors. The sensitivity realized in observations on the Centaurus A radio galaxy at a wavelength of 21 cm in the neutral-hydrogen line is only 30% less than the limiting value. Standard output devices for modulation type radiometers are used in the pulse-compensation state. (7 refs.)

104736 On the compensation of deformations of radio telescopes by the secondary reflector's control. E.E.Gasanov, M.M.Vainbrand, B.G.Karasik.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.105-9 (1982). In Russian.
Two methods of determining the secondary reflector's motion parameters for the compensation of deformations of a reflector are described. In the first method the average phase error is used as a criterion of optimization, in the second one directive efficiency is used. (7 refs.)

104737 A balloon-borne far-infrared telescope with a new azimuth stabilization system. N.Hiromoto, T.Maihara, N.Oda, H.Okuda, H.Shibai (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Mem. Fac. Sci. Kyoto Univ. Ser. Phys. Astrophys. Geophys. Chem. (Japan), vol.36, no.2, p.281-9 (March 1983). In Japanese.
A small telescope control system was developed for balloon-borne far-infrared scanning observations with medium angular resolution. The stabilization of a balloon gondola was performed by a reaction wheel-based servomechanical system driven by a torque motor, realizing pointing accuracy better than 0.1°. The method employed in this system is unique in that only the internal frame which the telescope is attached to is stabilized around a vertical axis of the gondola, while the outer gondola being oriented separately by the so-called twist-rewinding servo-system. The performance of the whole system is presented including the three-color far-infrared photometer actually used in the last observation. (5 refs.)

104738 An autoguider system for the 40 cm Schmidt telescope. H.Ohtani, T.Ichikawa, T.Sasaki, K.Saito, T.Tsujimura (Dept. of Astron., Univ. of Kyoto, Kyoto, Japan).
Mem. Fac. Sci. Kyoto Univ. Ser. Phys. Astrophys. Geophys. Chem. (Japan), vol.36, no.2, p.291-303 (March 1983). In Japanese.
An autoguider system was constructed for the 40 cm Schmidt telescope at the Ouda Station. The sensor of the guider, a type ITT FW 130 image dissector, is attached to the guiding telescope. A microprocessor is introduced for processing the sensor output and for correcting the guiding error of the telescope. This enables the broadening of the objective prism spectra by a simple software. The microprocessor is used also for other auxiliary functions for the telescope control. (7 refs.)

95.65 AUXILIARY AND RECORDING INSTRUMENTS

104739 Low light level detectors in astronomy. M.J.Eccles, M.E.Sim, K.P.Tritton.
Cambridge, England: Cambridge (1983), xii+187 pp. [0 521 24088 3]
This book deals with the detectors of optical radiation used in astronomy, for example photographic, television and electronic detectors. The different types of detector are compared, and the characteristics of each type of detector which fit it for work in some specialised area are explained. The range of available detectors is comprehensively covered, and much space is devoted to modern electronic detectors, for example charge-coupled devices of CCDs. The book is intended for astronomy students at MSc level and professional observational astronomers. (32 refs.)

95.75 TECHNIQUES OF OBSERVATION AND REDUCTION

104740 Comparison of the Mt. Stromlo/AAO and Caltech/Tololo infrared photometric systems. J.H.Elias, J.A.Frogel (Cerro Tololo Inter-American Obs., La Serena, Chile), A.R.Hyland, T.J.Jones.
Astron. J. (USA), vol.88, no.7, p.1027-30 (July 1983).
The transformations between the Mt. Stromlo/AAO and the Caltech/Tololo infrared photometric systems have been determined by means of observations of 21 stars with both systems. A small zero-point difference but no color term is found at *K*; color terms are found for the $J-K$, $J-H$, and $H-K$ colors. All scatter in the transformations can be attributed to the random errors in the observations. (11 refs.)

104741 The O IV infrared and ultraviolet flux ratios as temperature and density diagnostics. M.A.Hayes, H.Nussbaumer (Inst. of Astron., ETH Zentrum, Zurich, Switzerland).
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.279-82 (Aug. 1983).
Fine-structure collision strengths for transitions among the levels of the first two terms of O^{+3} are presented. The density sensitivity of the intensity ratios of the components of the intercombination multiplet at 1401 Å is re-evaluated for densities and temperatures applicable to planetary nebulae. The authors also show that the intensity ratio of the fine-structure line at 25.9 μm to the 1401 Å multiplet provides a diagnostic for electron temperature. The effect of radiation fields on the intensity ratios is investigated. (11 refs.)

104742 Small-scale fluctuations in the relict radio radiation. V.K.Dubrovich.
Bull. Spec. Astrophys. Obs.-North Caucasus (USA), vol.13, p.31-3 (1981). Translation of: *Astrofiz. Issled.-Izv. Spets. Astrofiz. Obs. (USSR)*, vol.13, p.40-2 (1981).
The origin of spectral and spatial fluctuations in the relict radio radiation is considered when remote galaxies move with respect to the background. The scatterers are considered to be the atoms and ions of the commoner elements (carbon and nitrogen) together with certain molecules. It is shown that this is the most promising way of locating galaxies for red shifts $z \geq 3$ since it is not related to the energy considerations for the galaxy. The distortion of the background temperature is determined only by the peculiar velocity and by the optical thicknesses in the fine-structure lines of C and N. (3 refs.)

104743 Raster equidensitometry applied to processing photographs from the 6 m telescope. M.F.Shabanov, V.V.Popov.
Bull. Spec. Astrophys. Obs.-North Caucasus (USA), vol.13, p.69-78 (1981). Translation of: *Astrofiz. Issled.-Izv. Spets. Astrofiz. Obs. (USSR)*, vol.13, p.85-97 (1981).
A raster equidensitometry method is developed for constructing isophots for astronomical objects that is 3-4 times more effective than ordinary equidensitometry. Measurements of noise and contrast transitions together with the number of objectively distinguishable gradations for 103aO and 111aJ emulsions provide quantitative estimates of the photometric accuracy in constructing isodenses and relating them to real isophots. The method is used to construct isophots and in morphological analysis of four interacting galaxies from Vorontsov-Vel'yaminov's atlas: VV 51, VV 243, VV 528, and VV 711. (14 refs.)

104744 Direct conversion of LOS acceleration data to vertical gravity anomalies: a new approach. A.W.G.Kunze (Dept. of Geology, Univ. of Akron, Akron, OH, USA).
Moon & Planets (Netherlands), vol.28, no.3, p.259-65 (June 1983).
Most of the existing lunar and planetary gravity data are in the form of LOS (line-of-sight) components which cannot be used for conventional geophysical modelling. A new methof od inverting LOS data is presented. It utilizes the fact that three non-coplanar LOS acceleration vectors determined at different times at some point of observation uniquely define the total acceleration vector at that point. Vector analysis shows that the local Cartesian components g_i of the total gravity anomaly vector may be obtained by inversion of the system $a_{ij}g_j = A_i^2$, where the a_{ij} and A_is are the local Cartesian components and scalar magnitudes of the three required LOS acceleration vectors. (15 refs.)

95.85 CATALOGUES, ATLASES ETC

104745 Medium size radio continuum loops and their association with H I shells. Y.Sofue (Tokyo Astron. Obs., Univ. of Tokyo, Nagano, Japan), N.Nakai.
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.57-70 (July 1983).
Radio continuum survey data at 408 and 820 MHz are examined in order to find very old supernova remnants, which might be hidden in the complicated background radio emission of the Galaxy. A method of substracting large-scale background structures of scale-sizes less than 4 degrees are abstracted. Among many loop-like features five loops of diameters 3-10 degrees are found to be associated with H I shells. They may be extremely old ($\sim 10^6$ yrs) SNRs at distances less than $\sim$ 1 kpc from the Sun. (19 refs.)

104746 Catalog of magnetic field measurements. P.Didelon (Obs. de Strasbourg, Strasbourg, France).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.119-37 (July 1983).
Ther catalog contains references to all measurements of stellar magnetic fields published in the literature between 1958 and 1981. The catalog provides for each object identifications, position, magnitude, period, extrema of the magnetic field measured, number of measurements, method used, spectral type, bibliographic references and notes. (230 refs.)

104747 Groups of galaxies. III. The CfA survey. M.J.Geller, J.P.Huchra (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Astrophys. J. Suppl. Ser. (USA), vol.52, no.2, p.61-87 (June 1983).
Presents a statistically homogeneous group catalog (CfA) based on the CfA redshift survey (Huchra et al. 1983). Groups in the catalog are all density enhancements in redshift space of a factor greater than 20. Group members are identified according to the procedure described in a previous study (Huchra and Geller, 1982) of a shallower whole-sky sample. All groups contain at least three members. (27 refs.)

104748 A catalog of spectral classification and photometry of barium stars. P.K.Lu (Western Connecticut State Univ. Obs., Danbury, CT, USA), D.W.Dawson, A.R.Upgren, E.W.Weis.
Astrophys. J. Suppl. Ser. (USA), vol.52, no.2, p.169-81 (June 1983).
A catalog of spectroscopic and photometric data for 221 barium stars is presented. All spectra were obtained with an image-tube system at a dispersion of 43 Å mm^{-1} at Hγ. The intensity of the λ4554 line of Ba II is estimated on a scale of 1 to 5 in a manner similar to that used by Warner (1965). Photometric data in the DDO and *UBVRI* systems have been obtained for most of these stars. (29 refs.)

104749 Third Greenwich catalogue of stars, Sun, planets and Moon for 1950.0. R.H.Tucker, M.E.Buontempo, P.Gibbs, R.H.D.Swifte (Royal Greenwich Obs., Hailsham, England).
R. Greenwich Obs. Bull. (GB), no.187, p.5-48 (1983).
Contains the results of observations made at Greenwich with the Airy Transit Circle from 1942 May 26 to 1954 March 30. The results for the Sun, planets and Moon (in Parts IV and V of the catalogue) represent re-reductions of the results previously published in the annual volumes of Greenwich Observations. (22 refs.)

96.00 SOLAR SYSTEM

96.10 GENERAL, SOLAR NEBULA, AND COSMOGONY

104750 Fragmentation of a nonisothermal protostellar cloud. A.P.Boss (Dept. of Terrestrial Magnetism, Carnegie Instn. of Washington, Washington, DC, USA).
Icarus (USA), vol.55, no.1, p.181-4 (July 1983).
The collapse of a very low thermal energy, rotating cloud results in fragmentation to a binary protostellar system even in the nonisothermal regime. The solar system therefore probably did not form from a fragmentation hierarchy involving ejection of the presolar nebula from a multiple system. (12 refs.)

104751 Implications of rare gas isotropic ratios for the age of the Solar System. R.W.Medeiros (Dept. of Chem., West Chester State Coll., West Chester, PA, USA).
Speculations Sci. & Technol. (Switzerland), vol.6, no.2, p.195-8 (June 1983).
The atmospheric ^{40}Ar/^{36}Ar ratios for the planets Mars-Earth-Venus are discussed. A marked increase in these values has been noted with increasing planetary distance from the Sun, implying differing degrees of ^{36}Ar outgassing. This is attributed to an early active sun, which produced lithospheric melting to depths dependent upon orbital distance. The results indicate that the Solar System may be older than the currently accepted age of 4.5 to 5.0 billion years. Suggestions are made for future investigations. (16 refs.)

96.20 MOON

104752 Grabens, basin tectonics, and the maximum total expansion of the Moon. M.P.Golombek, G.E.McGill (Dept. of Geology & Geography, Univ. of Massachussetts, Amherst, MA, USA).
J. Geophys. Res. (USA), vol.88, no.B4, p.3563-78 (10 April 1983). [received: Aug. 1983]
These structures have been explained as due to global expansion and contraction, basin subsidence, or both. Even if the extension implied by all lunar grabens were due to global expansion, the total radius increase permissible after terminal bombardment would be much less than that predicted by the most conservative models of lunar thermal evolution. The obvious areal association of most grabens and wrinkle ridges with impact basins suggests that a genetic relationship exists also. Both it is necessary to develop either kinematic or dynamic models to determine if basin subsidence alone can account for these structures. These models are developed and described. (31 refs.)

104753 A correlation between large-scale asymmetry of the Moon and the foci of moonquakes. G.X.Song (Dept. of Astron., Univ. of Manchester, Manchester, England).
Moon & Planets (Netherlands), vol.28, no.3, p.247-50 (June 1983).
Some evidence is produced to show that the Moonis asymmetric on the large scale as regards its figure, structure, composition, the distribution of tidal force, natural remnant magnetism and magnetic anomaly. This asymmetry produces the state of stress in the Moon, causing most foci of moonquakes to be located in the nearside of the Moon. (13 refs.)

104754 Origin of the Moon—capture by gas drag of the Earth's primordial atmosphere. K.Nakazawa (Geophys. Inst., Univ. of Tokyo, Tokyo, Japan), T.Komuro, C.Hayashi.
Moon & Planets (Netherlands), vol.28, no.3, p.311-27 (June 1983).
The authors propose a new scenario of the lunar origin. In this model the Earth grew up in a gaseous solar nebula and, consequently, the sphere of its gravitational influence (i.e. the Hill sphere) was filled by a gas forming a dense primordial atmosphere. In the later stages this atmosphere was dissipated gradually, owing to strong solar activity. Dynamical processes where a low-energy (i.e. slightly unbound) planetesimal is trapped within the terrestrial Hill sphere are studied. The orbital motion of such a planetesimal under solar gravity and atmospheric gas drag is calculated. The results show that a planetesimal with the lunar mass or less can be trapped if it enters the Hill sphere before the atmospheric density decreases to about 1/50 of the initial value. (25 refs.)

96.30 PLANETS AND SATELLITES

(exc. the Moon; for celestial mechanics, see 95.10; for Earth as an astronomical body, see 91. Geophysics)

104755 Perturbed particle disks. N.Borderies, P.Goldreich (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA), S.Tremaine.
Icarus (USA), vol.55, no.1, p.124-32 (July 1983).
The Boltzmann moment equations are solved to determine the velocity ellipsoid in a particle disk near an isolated satellite resonance. The particles are modeled as identical, indestructible, imperfectly elastic, smooth spheres. Gravitational interactions between particles are neglected. The solutions of the equations are used to set a bound on the deformation rate and to illustrate the significant characteristics of the angular momentum transport. Potential applications of the results to dynamical processes in planetary rings are outlined. (4 refs.)

104756 Planetary geodesy. W.L.Sjogren (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.3, p.528-37 (April 1983).
Deals with geodetic parameters of the planets and their satellites (including the Moon but not the Earth): shape, rotation, orientation, and gravity. A summary reference table of radii, masses, and gravity fields is provided. (182 refs.)

104757 Phase functions of atmosphereless bodies of the solar system. V.V.Shevchenko (P.K. Shternberg State Astron. Inst., Moscow, USSR).
Sol. Syst. Res. (USA), vol.16, no.4, p.164-70 (Oct.-Dec. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.4, p.209-15 (Oct.-Dec. 1982).
Compares the phase functions of the Moon, Mercury, Jupiter's Galilean satellites, Vesta, and Ceres. The effect of the surface on the integral phase brightness is investigated. The shadow function, which depends on the degree of cratering of the surface, has an effect on the phase curve and the opposition effect. The opposition effect decreases with increasing surface albedo. (19 refs.)

96.30E Venus

104758 5577-Å airglow and electron fluxes in the nighttime atmosphere of Venus. V.A.Krasnopol'skii.
Cosmic Res. (USA), vol.20, no.5, p.530-4 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.742-7 (Sept.-Oct. 1982). [received: June 1983]
Observations of the 5577-Å airglow by Veneras 9 and 10 agree with direct measurements of electron fluxes on the night side of the planet in the presence of a magnetic field of less than 18° inclination. An estimate of electron ionization by Pioneer Venus is extremely sensitive to the nature of the assumed electron spectrum at $E>50$ eV. Venera measurements of the electron flux were higher by an order of magnitude in the absence of a magnetic field, and agree with radio occultation data only for magnetic fields with an inclination smaller than 5°. Ionization by interplanetary light in the 584 Å helium line and meteoric ionization may be significant in maintaining the lower maximum of the ionosphere. (22 refs.)

104759 Evidence for helical kink instability in the Venus magnetic flux ropes. R.C.Elphic (Lab. for Planetary Atmospheres, NASA/Goddard Space Flight Center, Greenbelt, MD, USA), C.T.Russell.
Geophys. Res. Lett. (USA), vol.10, no.6, p.459-62 (June 1983).
Empirical models of the magnetic field structure of flux ropes found in the Venus ionosphere indicate that ropes are unstable to long wavelength (>100 km) helical kink perturbations. The onset of such an instability can explain the apparent volume distribution of flux ropes with altitude, and their orientation as a function of altitude. In the subsolar region, the fraction of volume that is occupied by flux ropes increases from roughly 20% at high altitudes to more than 50% at low altitudes, which is a greater increase than would be expected if ropes convect downward as simple straight horizontal cylinders. The helical kink instability increases the fractional volume occupied by ropes by turning the originally straight, horizontal flux tubes into corkscrew-shaped structures as they convect to lower altitudes. (8 refs.)

104760 Optical signature of Venus lightning as seen from space. M.A.Williams, L.W.Thomason (Inst. of Atmospheric Phys., Univ. of Arizona, Tucson, AZ, USA).
Icarus (USA), vol.55, no.1, p.185-6 (July 1983).
The calculations of Williams, Thomason, and Hunten (1982) for the light transmitted to space by a Venus lightning flash by dropping the use of similarity relations have been improved. This revised model increases their escape fractions and image sizes by about a factor of 2; however, their conclusions remain valid. (5 refs.)

104761 Venus: global surface radio emissivity. P.G.Ford, G.H.Pettengill (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA).
Science (USA), vol.220, no.4604, p.1379-81 (24 June 1983).
Observations of thermal radio emission from the surface of Venus, made by the Pioneer Venus radar mapper at a wavelength of 17 centimeters, show variations that are dominated by changes in surface emissivity. The regions of lowest emissivity (0.54 ± 0.05 for the highland areas of Aphrodite Terra and Theia Mons) correspond closely to regions of high radar reflectivity. These results support the inference of inclusions of material with high electrical conductivity in the surface rock of these areas. (14 refs.)

104762 Venera 13 and Venera 14: sedimentary rocks on Venus?. C.P.Florensky, A.T.Basilevsky, V.P.Kryuchkov, R.O.Kusmin, O.V.Nikolaeva, A.A.Pronin, I.M.Chernaya, Yu.S.Tyuflin, A.S.Selivanov, M.K.Naraeva, L.B.Ronca.
Science (USA), vol.221, no.4605, p.57-9 (1 July 1983).
Venera 13 and Venera 14 transmitted almost complete panoramic views of their landing sites. Analyses of the photogaphs show the presence of rock formations undergoing geomorphic degradation. The formations display ripple marks, thin layering, differential erosion, and curvilinear fracturings. Some of them are interpreted as lithified clastic sediments. The lithification could have taken place at depth or at the surface, resulting in a type of duricrust. The origin of the sediments is unknown but could be aeolian, volcanic, or related to impacts or to turbidity currents. (12 refs.)

96.30G Mars

104763 The role of seasonal reservoirs in the Mars water cycle. I. Seasonal exchange of water with the regolith. B.M.Jakosky (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).
Icarus (USA), vol.55, no.1, p.1-18 (July 1983).
Observations of the seasonal cycle of water vapor in the Mars atmosphere imply that there is a seasonal exchange of water with a reservoir of ice in the polar regions and of adsorbed water in the global near-surface regolith. The equilibrium between water vapor and adsorbed water is sufficiently temperature-dependent that seasonal surface temperature variations are capable of driving a large exchange of water between the atmosphere and subsurface. A one-dimensional model of this process is presented, and calculations are done of the amount of water exchanged seasonally at each latitude. (47 refs.)

104764 Orbital evolution and origin of the Martian satellites. A.M.K.Szeto (Res. School of Earth Sci., Australian Nat. Univ., Canberra, Australia).
Icarus (USA), vol.55, no.1, p.133-68 (July 1983).
The role of tidal dissipation within the Martian satellite system is examined through orbital evolution integrations and assessed in the context of its origin scenario through calculations of collision probabilities between Phobos and Deimos in the distant past. A wide range of assumptions concerning models of dissipation by anelastic tidal deformation within Mars and its satellites has been considered in investigating the possibility of a capture origin using generalized Q laws and the Darwin-Kaula formulation of the secular evolution equations. An accretion origin is preferred over capture, although an accretion model that is consistent with the likely carbonaceous chondritic composition of the Martian satellites has yet to be established. (92 refs.)

104765 The effect of orbital element variations on the mean seasonal daily insolation on Mars. E.Van Hemelrijck (Belgian Inst. for Space Aeronomy, Brussels, Belgium).
Moon & Planets (Netherlands), vol.28, no.2, p.125-36 (April 1983).
Studies changes in the mean seasonal insolation on the planet Mars caused by significant large-scale variations in the following orbital elements: the eccentricity (e), the obliquity (ϵ) and the longitude of perihelion (λ_p). Three orbital configurations are investigated. In the first, the eccentricity equals successively 0, 0.075, and 0.15, whereas for the obliquity and the longitude of perihelion the author takes the present values which amount, respectively to 25° and 250°. In the second situation, $\epsilon=15$, 25, and 35° for a circular orbit ($e=0$) with $\lambda_p=250°$. In the last model the author sets $e=0.075$ and $\epsilon=25°$ for $\lambda_p=-90$, 0, and 90°. (19 refs.)

96.30H Asteroids

104766 Infrared (*JHK*) photometry of asteroids. II. G.J.Veeder, D.L.Matson, G.Hoover (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), C.Kowal.
Astron. J. (USA), vol.88, no.7, p.1060-3 (July 1983).
For pt.I see ibid., vol.87, no.5, p.834-9 (1982). The authors report *JHK* (1.2, 1.6, and 2.2 μ) photometry for 38 asteroids of various spectral classifications. M asteroids tend to have infrared colors intermediate between the color domains of E and P asteroids. A few D asteroids have redder $J-H$ colors than most C asteroids. The unusually red $J-H$ color of 246 Asporina indicates it is a member of the A class. (15 refs.)

104767 The large C-type asteroids 146 Lucina and 410 Chloris, and the small S-type asteroids 152 Atala and 631 Philippina: rotation periods and lightcurves. H.J.Schober (Inst. fur Astron., Graz, Austria).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.71-5 (July 1983).
Photoelectric observations are presented for four ateroids. The rotation periods of 146 Lucina and 410 Chloris are found to be 18.54^h and 32.50^h, respectively. The rotation period of 152 Atala is found to be $5.282^h \pm 0.004^h$; the amplitude of the light curve is 0.50 mag. The rotation period and amplitude of 631 Philippina are $5.92^h \pm 0.01^h$, and 0.20 mag. Colours and magnitudes were measured for 146 Lucina, 410 Chloris and 631 Philippina; the colours of 631 Philippina showed no variation during the rotation period. (4 refs.)

104768 Lightcurves and rotation periods for the asteroids 70 Panopaea and 235 Carolina. .Schroll (Inst. fur Astron., Univ. Graz, Sattendorf, Austria), H.J.Schober.
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.77-9 (July 1983).
The asteroids 70 Panopaea and 235 Carolina were observed photoelectrically in UBV during four nights in September 1980. The rotation period and lightcurve amplitude of 70 Panopaea were found to be $15.87^7 \pm 0.04^h$ ($0.661^d \pm 0.002^d$), and 0.12 mag; for 235 Carolina the rotation period and amplitude are $17.56^h \pm 0.03^h$ ($0.732^d \pm 0.001^d$) and at least 0.35 mag. Both asteroids have double wave light curves. UBV colours were measured for both asteroids; no variation was found during the rotation period. (4 refs.)

104769 Physical studies of asteroids. XI. Photoelectric observations of the asteroids 2, 161, 216 and 276. M.Carlsson, C.-I.Lagerkvist (Astron. Obs., Uppsala, Sweden).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.157-9 (July 1983).
For pt.X see Moon and Planets, vol.27, no.4, p.463-6 (1982). Lightcurves and *UBV*-colours are presented for the asteroids 2 Pallas, 161 Athor, 216 Kleopatra and 276 Adelheid. For asteroid 216 a lightcurve amplitude of 1.1^m was observed. (9 refs.)

104770 The R asteroids reconsidered. G.J.Veeder, D.L.Matson, E.F.Tedesco (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Icarus (USA), vol.55, no.1, p.177-80 (July 1983).
JHK infrared photometry shows that R asteroids have two distinct infrared color domains. Most R asteroids have JHK and visual colors and albedos that fall amongst those observed for S asteroids, but a small subset is clearly different. These are designated as a new A class of asteroids. (24 refs.)

104771 Occultation of 14 Piscium by (51) Nemausa on 1983 Sept. 11. G.E.Taylor, A.R.Klemola.
I.A.U. Circ. (USA), no.3850, 1 pp. (12 Aug. 1983).
Presents an ephemeris for the central line of this occultation. (1 ref.)

104772 1983 LB. B.G.Marsden.
I.A.U. Circ. (USA), no.3853, 1 pp. (17 Aug. 1983).
Presents an ephemeris for the period 1983 August 4 to November 2, at five-day intervals. (1 ref.)

104773 1983 LC. B.G.Marsden.
I.A.U. Circ. (USA), no.3849, 1 pp. (5 Aug. 1983).
An ephemeris is presented for the period 1983 August 4 to September 23, at five-day intervals. (1 ref.)

104774 Photoelectric photometry of 2 Pallas. C.J.Cunningham.
J. R. Astron. Soc. Can. (Canada), vol.77, no.3, p.121-5 (June 1983).
Photoelectric observations of the asteroid 2 Pallas are presented. Data were obtained on three nights in 1982 April. A phase coefficient of 0.037^m per degree, an absolute magnitude of 4.11^m, an albedo of 0.10, a diameter of 630 km, and a period of 8.16^h are computed. (4 refs.)

104775 Minor Planet Circulars.
Minor Planet Circ. (USA), no.7791-7874, 84 pp. (27 April 1983).
Present precise positions for asteroids and ten comets observed at eight observatories or observing stations. Identification changes are given for 30 asteroids and 11 objects are identified with numbered minor planets. 71 corrected observations are also presented. Orbital elements are given for 56 one-opposition asteroids, newly-numbered asteroids 2865-2881, three named and

three previously numbered objects as well as 24 asteroids still with just discovery designations including one Palomar-Leiden object. Ephemerides are given for four comets and 84 minor planets for the inclusive period 1983 April 16-1984 August 28 at 10-day intervals and for Periodic Comets Encke and Crommelin for the inclusive period 1983 August 14-1984 October 7 at 5- and 10-day intervals as appropriate.

104776 Minor Planet Circulars 7875-7980.
Minor Planet Circ. (USA), no.7875-7980, 106 pp. (26 May 1983).
Present precise positions for asteroids and 16 comets observed at 26 observatories or observing stations. Identification changes are given for four asteroids and 18 corrected and three deleted observations are also presented. Orbital elements are given for 198 one-opposition asteroids, and newly numbered asteroids 2882-2888 as well as 23 asteroids still with just discovery designations including eight Palomar-Leiden objects. Ephemerides are given for 93 minor planets for the inclusive period 1983 May 26−1984 March 21 at 10-day intervals. Finally new names are given to 57 asteroids.

104777 Minor Planet Circulars 7981-8024.
Minor Planet Circ. (USA), no.7981-8024, 44 pp. (25 June 1983).
Present precise positions for asteroids and 72 comets observed at 57 observatories or observing stations. Identification changes are given for 63 asteroids. 69 corrected observations and 11 deleted observations are also presented. Orbital elements are given for seven one-opposition asteroids, newly numbered asteroids 2889-2892, 11 named objects as well as four asteroids still with just discovery designations including one Palomar-Leiden object. Ephemerides are given for four minor planets for the inclusive period 1983 July 5-1984 March 21 at 10-day intervals. An index to the orbital elements of eight comets, 19 periodic comets, and 1669 asteroids is given on MPC 8000-8007.

104778 Results of astrophysical investigations of asteroids (survey). I. D.F.Lupishko, I.N.Bel'skaya (A.M. Gor'ki State Univ., Kharkov, Ukrainian SSR).
Sol. Syst. Res. (USA), vol.16, no.4, p.153-64 (Oct.-Dec. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.4, p.195-208 (Oct.-Dec. 1982).
Contains the results of photometric investigations of the physical properties of asteroids. (66 refs.)

96.30K Jupiter

104779 Reconnection in the Jovian magnetosphere. A.Nishida (Inst. of Space & Astronautical Sci., Tokyo, Japan).
Geophys. Res. Lett. (USA), vol.10, no.6, p.451-4 (June 1983).
In the nightside Jovian magnetosphere, Voyager 1 and 2 detected signatures of reconnection. The anti-sunward streaming events, recognized and designated as magnetospheric winds by Krimigis et al., were clearly associated with the northward inclination of the magnetic field. The reconnection is likely to be due to the need to adjust the length of the extended nightside field lines to the dimension of the dayside magnetosphere, but it is not a steady-state feature and shows considerable variability. In addition to these events, there were numerous occasions where northward and southward field polarities were mixed at the neutral sheet. These latter events were observed by Voyager 2 beyond about 80 R_J where the observed field across the neutral sheet exceeded the dipole field strength, and they probably represent the product of the tearing mode. (14 refs.)

104780 Voyager photometry of Europa. B.Buratti, J.Veverka (Lab. for Planetary Studies, Cornell Univ., Ithaca, NY, USA).
Icarus (USA), vol.55, no.1, p.93-110 (July 1983).
Ninety Voyager images ranging in phase angle from 3 to 143° and covering the spectral range from 0.34 to 0.58 μm were analyzed to derive the photometric properties of Europa. (31 refs.)

104781 The interiors of the giant planets−1983. R.Smoluchowski (Dept. of Astron. & Phys., Univ. of Texas, Austin, TX, USA).
Moon & Planets (Netherlands), vol.28, no.2, p.137-54 (April 1983).
The last few years have brought progress in our understanding of the interiors of the giant planets especially of the two larger ones which have been visited by the Pioneer and Voyager spacecraft. An analysis of the formation of the giant planets helps to clarify certain important common features. The presently available model of Jupiter is still based on certain somewhat bothersome approximations but it appears to satisfy the main observational constraints. Saturn's interior is much better understood than it was previously although the quantitative aspects of the role of the miscibility gap in the hydrogen-helium system have not yet been entirely resolved. Much attention has been directed at the interiors of Uranus and Neptune. Both the two- and the three-layer models are moderately successful. Serious difficulties arise from the considerable uncertainties concerning the rotational periods of both planets. (43 refs.)

96.30M Saturn

104782 Scheme for the formation of the rings of Saturn and the nature of the Cassini Division. V.D.Davydov.
Cosmic Res. (USA), vol.20, no.5, p.535-46 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.748-59 (Sept.-Oct. 1982). [received: June 1983]
A unified solution of two problems is proposed on the basis of an analysis of the observed properties of the rings of Saturn: the problem of the width of the Cassini Division and the question of the cause of a former satellite of Saturn descending into the region of tidal disruption. A scheme for the formation of the system of rings is constructed, and specific characteristics of the former satellite from which it originated are derived. The published results on the observations of the rings of Saturn from Voyager 1 and Voyager 2 are used in the work. (29 refs.)

104783 Detached plasma in Saturn's front side magnetosphere. C.K.Goertz (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany).
Geophys. Res. Lett. (USA), vol.10, no.6, p.455-8 (June 1983).
Discusses plasma observations in the outer front side Saturnian magnetosphere which indicate the existence of dense flux tubes outside the plasma sheet. It is suggested that flux tubes are detached from the plasma sheet by a centrifugally driven flute instability. The same instability leads to a dispersal of Titan-injected plasma. It is shown that the detached flux tubes will probably break open as they convect into the nightside magnetotail and lose their content in form of a planetary wind. (16 refs.)

104784 Vertical distribution of scattering hazes in Titan's upper atmosphere. K.Rages, J.B.Pollack (NASA Ames Res. Center, Moffett Field, CA, USA).
Icarus (USA), vol.55, no.1, p.50-62 (July 1983).
Radial intensity scans of a Voyager 2 high phase angle image of Titan have been inverted to yield vertical extinction profiles at 1° intervals around the limb. A detached haze layer with peak particle number densities ~ 0.2 cm^{-3} exists at all latitudes south of $\sim 45°$N, and at an altitude of 300-350 km. The optical depth 0.01 level lies at a radius of 2932 ± 5 km at the equator and at a radius of 2915 ± 10 km over the poles (altitudes of 357 ± 5 and 340 ± 10 km, respectively). In addition to the haze layer at 300-350 km, there is a small enhancement in the extinction at ~ 450 km which exists at all latitudes between 75°S and $\sim 60°$N. (14 refs.)

104785 Collision-induced absorption in the far infrared spectrum of Titan. J.L.Hunt (Dept. of Phys., Univ. of Guelph, Guelph, Ontario, Canada), J.D.Poll, D.Goorvitch, R.H.Tipping.
Icarus (USA), vol.55, no.1, p.63-72 (July 1983).
After a review of the procedure for the theoretical calculation of the N_2 translation-rotational spectrum, new results for the temperature range of 70 to 120K are reported. These are used as input data for a simple atmospheric model in order to compute the far infrared radiance, brightness temperature, and spectral limb function. This source of opacity alone is not capable of explaining the Voyager results. When the collision-induced methane is included, the results are in closer agreement in the range between 200 and 300 cm^{-1}, suggesting that a more complete treatment of collision-induced absorption including particularly CH_4-N_2, N_2-H_2, and H_2-H_2 results, may provide sufficient opacity to reduce or obviate the need for opacities due to clouds or aerosols in order to explain the observed spectra. (21 refs.)

104786 Galactic cosmic rays and N_2 dissociation on Titan. L.A.Capone (Dept. of Meteorology, San Jose State Univ., San Jose, CA, USA), J.Dubach, S.S.Prasad, R.C.Whitten.
Icarus (USA), vol.55, no.1, p.73-82 (July 1983).
The electromagnetic and particle cascade resulting from the absorption of galactic cosmic rays in the atmosphere of Titan is shown to be an important mechanism for driving the photochemistry at pressures of 1 to 50 mbar in the atmosphere. In particular, the cosmic ray cascade dissociates N_2, a process necessary for the synthesis of nitrogen organics such as HCN. The important interactions of the cosmic ray cascade with the atmosphere are discussed. The N_2 excitation and dissociation rates and the ionization rates of the principal atmospheric constituents are computed for a Titan model atmosphere that is consistent with Voyager 1 observations. (41 refs.)

104787 Plasma clouds in Saturn's rings. G.E.Morfill (Max-Planck-Inst. fur Extraterrestrische Phys., Garching, Germany), C.K.Goertz.
Icarus (USA), vol.55, no.1, p.111-23 (July 1983).
The expansion and ionization of vapor produced by impacts of meteorites on Saturn's rings is described. There is an 'impact plasma' produced in the initial collision, and a 'secondary plasma' produced by subsequent ionization of the neutral gas ejecta. The dynamics of these plasma clouds, their size, density, and life time are calculated. It is suggested that large clouds, produced by meter-sized meteorites may lead to the formation of spokes. (36 refs.)

104788 A second order Jupiter-Saturn planetary theory. II. O.M.Kamel (Astron. Dept., Faculty of Sci., Cairo Univ., Cairo, Giza, Egypt), A.Aziz Bakry.
Moon & Planets (Netherlands), vol.28, no.2, p.113-23 (April 1983).
For pt.I see ibid., vol.27, no.4, p.417-30 (1982). The authors complete the establishment of a second order secular Jupiter-Saturn theory (Kamel and Bakry, 1982). This is achieved by taking into consideration the influence of the indirect part of the planetary disturbing function, and expressing the second order secular Hamiltonian in terms of Poincare's canonical variables. (10 refs.)

104789 The shape of the small satellites of Saturn: gravitational equilibrium vs. solid-state strength. P.Farinella, A.Milani, A.M.Nobili (Dipartimento di Matematica, Univ. Pisa, Pisa, Italy), P.Paolicchi, V.Zappala.
Moon & Planets (Netherlands), vol.28, no.3, p.251-8 (June 1983).
Among the small satellites of Saturn there is a transition from irregularly-shaped, strength-dominated objects to larger, gravity-dominated bodies with shapes roughly fitting the theoretical equilibrium figures. The transition occurs for a radius of 100 ± 50 km, corresponding to a typical material strength of the order of 10^7 dynes cm^{-2}. Mimas, Enceladus, Hyperion, Phoebe and the small coorbital and F-ring shepherding moons are discussed; and it is shown that an analysis of the shape data can provide interesting results on the physical properties, origin and collisional history of these objects. (17 refs.)

104790 Titan: discovery of carbon monoxide in its atmosphere. B.L.Lutz (Planetary Res. Center, Lowell Obs., Flagstaff, AZ, USA), C.De Bergh, T.Owen.
Science (USA), vol.220, no.4604, p.1374-5 (24 June 1983).
The 3-0 rotation-vibration band of carbon monoxide in the near-infrared spectrum of Titan has been identified, and a reflecting layer model mixing ratio of carbon monoxide to molecular nitrogen of 6×10^{-5} has been determined. This result supports the probable detection of carbon dioxide by Samuelson and his co-workers and strengthens possible analogies between the atmosphere of Titan and conditions on the primitive Earth. (12 refs.)

104791 Is Titan wet or dry?. R.Eshleman (Stanford Univ., Stanford, CA, USA), G.F.Lindal, G.L.Tyler.
Science (USA), vol.221, no.4605, p.53-5 (1 July 1983).
Titan's dense and cold nitrogen atmosphere contains a small amount of methane under conditions at least approaching those at which one or both constituents would condense. From specific features of radio occultation and other Voyager results, however, it is concluded that nitrogen does not condense on Titan and that Titan has neither global methane oceans nor a global cloud of liquid methane droplets. However, other considerations favor a methane ice haze high in the troposphere and liquid and solid methane might exist on the surface and as low clouds at polar latitudes. (19 refs.)

104792 Oceans on Titan?. F.M.Flasar (NASA Goddard Space Flight Center, Greenbelt, MD, USA).
Science (USA), vol.221, no.4605, p.55-7 (1 July 1983).
If global oceans of methane exist on Titan, the atmosphere above them must be within 2 percent of saturation. The two Voyager radio occultation soundings, made at low latitudes, probably occurred over land, since they imply a relative humidity ≤ 70 percent near the surface. Oceans might exist at other low-latitude locations if the zonal wind velocities in the lowest 3 kilometers are ≤ 4 centimeters per second. (24 refs.)

104793 Weak dynamical effects in the Uranian ring system. A.P.Freedman (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA), S.Tremaine, J.L.Elliot.
Astron. J. (USA), vol.88, no.7, p.1053-9 (July 1983).
A number of weak gravitational forces were examined for their kinematic effects on the Uranian ring system, in an attempt to account for errors of ~ 2 km between the ring positions and the best fitting orbit model. The principal conclusions are as follows: (1) Perturbations by the five known satellites, with the best current estimates of the satellite masses, are too small to have observable effects. (2) Limits can be set on the masses of possible inter-ring 'shepherd' satellites from their influence on apse precession rates and their radial perturbations of the rings. For example, the maximum mass of a shepherd satellite between rings 4 and 5 would be $\sim 10^{19}$ g. (3) Using the best available ring orbit parameters, there is no convincing evidence that the rings are associated with resonances with known satellites. The only close association is of rings 5, α, and γ with three-body resonances due to Miranda and Ariel. It is possible, however, that the shepherd satellites occupy these resonances. (4) The known satellites could cause the observed residuals by changing the position of Uranus relative to the system barycenter during an occultation. The maximum change so far, during the 1981 April 26 event, was ~ 2 km. This effect is currently being studied with the MIT Uranus ring model. (32 refs.)

104794 Absolute spectrophotometry of Neptune: 3390 to 7800 Å. J.T.Bergstralh (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), J.S.Neff.
Icarus (USA), vol.55, no.1, p.40-9 (July 1983).
Absolute spectrophotometry of Neptune from 3390 to 7800 Å, with spectral resolution of 10 Å in the interval 3390-6055 and 20 Å in the interval 6055-7800 Å, is reported. The results are compared with filter photometry and with synthetic spectra computed on the basis of a parameterization proposed for aerosol scattering and absorption. A CH_4/H_2 ratio is derived for the convectively mixed part of Neptune's atmosphere, and constrains optical properties of hypothetical aerosol layers. (23 refs.)

104795 The Uranian satellites: surface compositions and opposition brightness surges. R.Hamilton Brown (Planetary Geosci. Div., Hawaii Inst. of Geophys., Honolulu, HI, USA), D.P.Cruikshank.
Icarus (USA), vol.55, no.1, p.83-92 (July 1983).
High-precision spectrophotometry at 5% resolution has been obtained for the Uranian satellites Ariel, Umbriel, Titania, and Oberon. These spectra cover the wavelength region 1.43-2.57 μm and represent a substantial improvement in precision or wavelength coverage over previous studies. The 1.5- and 2.0-μm water absorption band depths and the continuum reflectance indicate significant differences among the surface compositional properties of the four satellites. Preliminary measurements of the near-infrared opposition brightness surges of Ariel, Titania, and Oberon show them to be among the largest in the solar system. (24 refs.)

104796 The elimination of the critical terms of a first order Uranus-Neptune theory by Hori's method. II.. O.M.Kamel (Dept. of Astron., Cairo Univ., Giza, Egypt).
Moon & Planets (Netherlands), vol.28, no.3, p.221-45 (June 1983).
For pt.I see ibid., vol.27, no.4, p.407-15 (1982). The values of S_1 $(\hat{F}_1)_p$ and $(\bar{F}_1)_p$ are determined in terms of the canonical variables of Poincare. A complete solution of the auxiliary system of equations generated by the Hamiltonian $(\bar{F}_1)_p$ is presented. (19 refs.)

104797 New light on cold worlds.
Sky & Telesc. (USA), vol.66, no.1, p.23-5 (July 1983).
The author describes optical and near-infrared observations of Pluto and Triton, which have provided evidence for the existence of methane on both bodies. It is possible that Pluto has both a methane atmosphere and a surface layer of methane frost; large variations in atmospheric pressure are to be expected during the Plutonian year as methane freezes or sublines. In contrast no atmosphere has been detected on Triton, and methane ice appears to be confined mostly to one hemisphere; however, there does appear to be a shallow ocean of liquid nitrogen near Triton's south pole. (no refs.)

96.50 OTHER OBJECTS IN THE PLANETARY SYSTEM

96.50D Interplanetary matter, magnetic and electric fields

(inc. gegenschein and zodiacal light; see also 94.60 Interplanetary space)

104798 The Poynting-Robertson effect and lifetimes of micrometeoroids. I.Kapisinsky (Astron. Inst., Slovak Acad. of Sci., Bratislava, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.167-73 (June 1983).
The Poynting-Robertson effect is discussed, taking into account the mass loss of meteoroids caused by impact erosion. This effect, together with the consequent diffraction of light on the particle, can substantially change the radiation-pressure efficiency in the micron and submicron size ranges of particles. A correction function, involving the two phenomena, is derived and applied to the classical Poynting-Robertson equations. It is shown that the impact erosion has very strong effects on the dynamics and lifetimes of microparticles. In the motion of dust particles it is possible to distinguish five phases with different regimes of their motion. (24 refs.)

104799 Can solar wind induce the luminescence emission in zodiacal grains?. J.Svatos (Dept. of Astron. & Astrophys., Charles Univ., Praha, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.191-2 (June 1983).
Colourization effects in zodiacal grains due to solar high-speed streams are discussed. It is argued that the occurrence of luminescence emission in interplanetary grains is very improbable. (13 refs.)

104800 Mass loss rate of the zodiacal dust cloud. T.Mukai (Kanazawa Inst. of Technol., Ishikawa, Japan).
Moon & Planets (Netherlands), vol.28, no.3, p.305-9 (June 1983).
The mass loss rate of the zodiacal dust cloud near the Sun has been estimated on the basis of the orbital behaviour of circumsolar dust grains suffering sublimation. It is found that the solar dust ring located at 4 solar radii from the Sun, which consists of grains whose inward spiraling due to the Poynting-Robertson effect is stopped by the influence of sublimation, loses its mass at a rate of 3.5 to 0.35 tons per second. (15 refs.)

96.50G Comets

104801 Comet Swift-Tuttle and the Perseids. J.Rao.
Astronomy (USA), vol.11, no.8, p.16-22 (Aug. 1983).
Describes the independent discoveries of Comet 1862b, later designated Periodic Comet Swift-Tuttle (1862 III), and its visual appearance. The comet's connection with the Perseid meteor shower is reviewed and the likelihood of recovering the comet at its next apparition is considered. (no refs.)

104802 Classification of cometary orbits based on the concept of orbital mean temperature. J.Klinger (Lab. de Glaciologie et de Geophys. de l'Environnement, CNRS, St. Martin d'Heres, France).
Icarus (USA), vol.55, no.1, p.169-76 (July 1983).
The orbital mean temperature for periodic cometary orbits has been calculated as a function of eccentricity e for $0 \leq e \leq 0.97$, the semimajor axis a for $1 \leq a \leq 100$ AU, and for an albedo $A=0$. If water ice is the major constituent of comets, d'Arrest, Encke, Oterma, Schwassmann-Wachmann 2, and Tempel 2 contain crystalline ice. In the past, they must have experienced a short period of high activity due to the phase transition from amorphous to cubic ice. The actual low activity of those comets is not necessarily due to depletion of volatiles. The present statements are also valid for albedos $A \leq 0.3$. The results are generalized to other periodic orbits. (16 refs.)

104803 Periodic Comet Wolf (1983m). J.Gibson.
I.A.U. Circ. (USA), no.3850, 1 pp. (12 Aug. 1983).
It is reported that Periodic Comet Wolf has been recovered as a 20th-magnitude object in Ophiuchus. Two precise positions are reported for 1983 August 1 and 3. (2 refs.)

104804 Periodic Comet Crommelin (1983n). S.Wyckoff, P.A.Wehinger, L.Kohoutek, B.G.Marsden.
I.A.U. Circ. (USA), no.3851, 1 pp. (17 Aug. 1983).
It is reported that this comet has been recovered as a 20th-magnitude object in Vulpecula. Three semi-accurate positions and one precise position are reported, covering the period 1983 August 9 to 13. In addition an ephemeris is given for the period 1983 July 25 to December 12, at ten-day intervals. (2 refs.)

104805 Comet Cernis (1983l). S.Furuyama, Yu.V.Batrakov, B.G.Marsden, J.Bortle.
I.A.U. Circ. (USA), no.3852, 1 pp. (17 Aug. 1983).
Precise positions are reported for the period 1983 August 5 to 10. Parabolic orbital elements are given. Finally total visual magnitude estimates and coma diameters are reported for the period 1983 August 3 to 16. (1 ref.)

104806 Periodic Comet IRAS (1983j). J.Bortle.
I.A.U. Circ. (USA), no.3854, 1 pp. (22 Aug. 1983).
Total visual magnitude estimates are reported for 1983 August 15 and 16. (no refs.)

104807 Comet Cernis (1983l). T.Seki, A.C.Gilmore, B.G.Marsden.
I.A.U. Circ. (USA), no.3848, 1 pp. (5 Aug. 1983).
Three precise positions are reported, for 1983 July 25 and 26. Improved parabolic orbital elements are given, together with an ephemeris for the period 1983 August 4 to September 23, at ten-day intervals. (no refs.)

104808 Periodic Comet Russell 3 (1983i). B.G.Marsden.
I.A.U. Circ. (USA), no.3849, 1 pp. (5 Aug. 1983).
An ephemeris is presented for the period 1983 August 4 to November 22, at ten-day intervals. (1 ref.)

104809 Periodic Comet Tempel 2 (1982d). C.S.Morris, J.Bortle, D.Machholz.
I.A.U. Circ. (USA), no.3849, 1 pp. (5 Aug. 1983).
Total visual magnitude estimates are reported for the period 1983 July 10 to 22. (no refs.)

104810 1983d: May's surprise comet. B.G.Marsden, D.W.E.Green (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Sky & Telesc. (USA), vol.66, no.1, p.26-9 (July 1983).
The authors describe the discovery of Comet IRAS-Araki-Alcock (1983d) and observations during its close approach during May 1983. This comet passed 0.03 a.u. from the Earth on May 11th and reached an apparent visual magnitude of 1.5. The comet was observed by optical telescopes and by the IUE satellite, and radar echoes were obtained on May 11th by the Arecibo radio telescope. (no refs.)

96.50K Meteors, showers and meteoroids

104811 Photographic data on the Traunstein fireball (EN 290181, Jan. 29, 1981) and suspected meteorite fall. Z.Ceplecha, J.Bocek, M.Novakova (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia), G.Polnitzky.
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.162-7 (June 1983).
Geometric, dynamic, photometric and orbital data on the Traunstein Fireball photographed at two Czech stations of the European Network are given. A multiple meteorite fall of 3 to 4 bodies of comparable mass close to 1 kg is predicted, the mass of the biggest fragment is determined at 1.0 ± 0.2 kg and its impact point and area are computed. Indirect data on fragmentation of the type-II-fireball body are presented and a carbonaceous chondrite fall proposed. The meteorite search activities are briefly described. (6 refs.)

104812 A study of the disintegration of meteoric particles moving in the atmospheres of the Earth, Mars, and Venus. E.Z.Apshtein, N.N.Pilyugin, N.V.Vartanyan.
Cosmic Res. (USA), vol.20, no.5, p.519-24 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.730-5 (Sept.-Oct. 1982). [received: June 1983]
The problem of the motion of a meteoric particle is studied, taking into account its nonstationary heating and its change of shape form evaporation in the rarefied layers of the atmospheres of Earth, Venus, and Mars. Numerical calculations are made for a series of stony particles. The removal of mass

from the particles, their temperatures and intensity of radiation, and a meteoric trail's electron concentration at successive moments of time during the motion along the trajectory are determined. For the atmosphere of the Earth the authors compare the results with the known approximate solutions of the physical theory of meteors and the results of observations. Distinctive features are pointed out in the disintegration of meteoric particles in the different atmospheres. The authors propose methods for determining atmospheric parameters from observations of the motion of meteoric particles. (22 refs.)

104813 Physical parameters of meteoroids undergoing quasicontinuous crushing in the atmosphere. II. Interpretation of the parameters. V.V.Kalenichenko (Astron. Obs., Kiev Univ., Kiev, Ukrainian SSR).
Sol. Syst. Res. (USA), vol.16, no.4, p.171-7 (Oct.-Dec. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.4, p.216-22 (Oct.-Dec. 1982).
For pt.I see Astron. Vestn., vol.16, no.2, p.116-23 or Sol. Syst. Res., vol.16, no.2, p.86-93 (1982). Discusses the values of the physical parameters of meteoroids obtained by analyzing the observed light curves of meteoroids. A model of quasicontinuous fragmentation of the surface layer of the meteoroid is used which includes the effects of variable heat transfer. About half of the meteoroid experiences only a single evaporation. About half of the meteoroids investigated were destroyed in the atmosphere while still in the solid phase. The rest were destroyed by ablation from a liquid phase. Nothing distinctive is found about the bodies which give rise to bright photographic meteors. (35 refs.)

104814 Genetic relationship between the Taurid meteor swarm and Comet Encke-Baklund. L.A.Katasev, N.V.Kulikova (Moscow Engng.-Phys. Inst., Moscow, USSR).
Sol. Syst. Res. (USA), vol.16, no.4, p.177-84 (Oct.-Dec. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.4, p.223-30 (Oct.-Dec. 1982).
Discusses a mechanism for forming the Taurid meteor swarm by ejection of material from the nucleus of Periodic Comet Encke. The swarm may have been formed as a result of 'normal' comet activity. It does not seem to be necessary to adopt the hypothesis that the swarm originated when the comet nucleus collided with asteroids. (8 refs.)

104815 Perseid shower in 1980. V.V.Martynenko, A.I.Grishchenyuk, A.A.Kozlov, A.S.Levina, Yu.V.Lyzhin (All-Union Astron. & Geodetic Society, USSR).
Sol. Syst. Res. (USA), vol.16, no.4, p.191-8 (Oct.-Dec. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.4, p.238-46 (Oct.-Dec. 1982).
The results of observations of the high activity of the Perseid meteor shower in 1980 are given. The hourly rates and indices of relative activity are calculated, the brightness distribution of the Perseids is obtained, and the structure of the radiants of the stream and their displacement are investigated. (13 refs.)

Characteristic curve of meteoric spectrograms obtained by an optical diffraction transmission grating .... See Entry 100881

96.50M Meteorites, micrometeorites

104816 Cosmogenic records in Antarctic meteorites. J.N.Goswami (Phys. Res. Lab., Ahmedabad, India), K.Nishiizumi.
Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.1, p.1-8 (July 1983).
Aliquot samples of twenty-nine Antarctic L and H chondrites were analyzed for their nuclear track records and ^{53}Mn activities. Track density in the analyzed samples range from 10^4 to $\sim 6\times 10^6$ cm^{-2}. An important finding is the observation of track-rich grains in a set of four L3 chondrites ALPHA 77215, 77216, 77217 and 77252 which are suspected to belong to the same fall. ^{53}Mn activity is at near saturation level in ~65% of the analyzed samples. Combined analysis of ^{53}Mn and nuclear track data makes it possible to estimate the preatmospheric sizes of some of these meteorites. (40 refs.)

104817 Large-scale explosion in the inhomogeneous atmosphere of the Earth with allowance for spectral radiation. L.V.Shurshalov.
Fluid Dyn. (USA), vol.17, no.6, p.916-22 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.124-30 (Nov.-Dec. 1982).
The author has continued his work on systematic calculations of a very specific explosion that simulates the explosion of the Tungusska meteorite with a simple description of the radiation emitted by the hot gas (diffusion approximation and gray-body model). For the same simulated explosion, a study is made of the importance of the spectral dependence of the absorption coefficient on the radiation frequency. This dependence is taken into account in the multigroup approximation. The results are compared with those obtained earlier using the gray-gas model. (19 refs.)

104818 I-Xe and ^{40}Ar-^{39}Ar analyses of silicate from the Eagle Station pallasite and the anomalous iron meteorite Enon. S.Niemeyer (Phys. Dept., Univ. of California, Berkeley, CA, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.6, p.1007-12 (June 1983).
Silicate from two unusual iron-rich meteorites was analyzed by the I-Xe and ^{40}Ar-^{39}Ar techniques. Enon, an anomalous iron meteorite with chondritic silicate, shows no loss of radiogenic ^{40}Ar at low temperature, and gives a plateau age of 4.59 ± 0.03 Ga. Although the Xe data fail to define an I-Xe correlation the inferred Pu/U ratio is more than 2σ above the chondritic value. These findings suggest that presence of chondritic silicate in an iron-rich meteorite is diagnostic of an old radiometric age with little subsequent thermal disturbance. Eagle Station gives a complex ^{40}Ar-^{39}Ar age pattern which suggests a recent ($\lesssim$0.85 Ga) severe thermal disturbance. (17 refs.)

104819 Nitrogen and xenon in acid residues of iron meteorites. S.V.S.Murty, P.S.Goel (Dept. of Chem., Indian Inst. of Technol., Kanpur, India), D.V.Minh, Yu.A.Shukolyukov.
Geochim. & Cosmochim. Acta (GB), vol.47, no.6, p.1061-8 (June 1983).
Total nitrogen, measured by neutron activation analysis, is highly enriched in residues from iron meteorites obtained by dissolution of the metal in dilute H_2SO_4, relative to the bulk value. On the average, the residues, representing 3% mass, contain 22% of total N. Total Xe has been measured in several residues and its isotopic composition is similar to atmospheric Xe for mass numbers 131 to 136 but not for ^{124}Xe and ^{126}Xe which are strongly depleted in the nonmagnetic residues. It is suggested that iron meteorites have trapped in their micro-inclusions some pre-solar nebular matter which is isotopically heterogeneous. (36 refs.)

104820 The Tunguska explosion of 1908: discovery of meteoritic debris near the explosion site and at the South Pole. R.Ganapathy (Res. Lab., J.T. Baker Chem. Co., Phillipsburg, NJ, USA).
Science (USA), vol.220, no.4602, p.1158-60 (10 June 1983).
Submillimeter-sized metallic spheres extracted from soil in the Tunguska region of central Siberia contain noble metals in cosmic proportions. The trace element composition and geographical distribution of these spheres suggest that they are from the 30 June 1908 Tunguska explosion. Debris from this explosion was also discovered in a South Pole ice core; this discovery indicates that the Tunguska object exploded in the atmosphere with subsequent stratospheric injection and transport of the debris. The celestial body that exploded over Tunguska weighed more than 7 million tons, was more than 0.16 kilometer in diameter, and may well have been a stony meteorite. (17 refs.)

104821 Interstellar matter in meteorites. R.S.Lewis, E.Anders (Univ. of Chicago, Chicago, IL, USA).
Sci. Am. (USA), vol.249, no.2, p.54-66 (Aug. 1983).
Carbonaceous chondrites, the most primitive meteorites, are shown to incorporate material originating from outside the Solar System, including matter expelled by supernova and other stars. (no refs.)

104822 Secondary minerals and structurs of iron fragments of the Kaali meteorite. I.A.Yudin, V.N.Loginov, V.G.Gmyra, V.I.Koval', N.F.Obotnin (S.M. Kirov Ural Polytech. Inst., Acad. of Sci., USSR).
Sol. Syst. Res. (USA), vol.16, no.4, p.185-90 (Oct.-Dec. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.4, p.231-7 (Oct.-Dec. 1982).
A study of 226 iron fragments of the Kaali meteorite, which were collected near craters 2-8 and 5 (which have diameters of 40-20 and 13 m, respectively), has been carried out. Using mineralogical analyses, plastic deformation structures have been found to exist in kamacite and schriebersite as well as olivine grains in kamacite. Taenite globules 1-5 μm in size, formed as a result of melting during crater formation, were observed in the samples. A large number of taenite lamellae and separate schriebersite and olivine inclusions was found. This allows the small sizes of the metallic fragments and the anomalous content of crusts and plates in the finely dispersed material to be explained. (18 refs.)

96.60 SOLAR PHYSICS

104823 Small scale solar magnetic fields and their relation to various solar activity indices. B.P.Tritakis (Res. Center for Astron. & Appl. Math., Acad. of Athens, Athens, Greece).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.141-7 (June 1983).
Correlates various solar activity indices with a long time series of annual sums of the maximum value of solar magnetic field intensity for groups of sunspots. Faculae have a significant contribution to the small scale solar magnetic fields. The area index of the solar activity is related to the maximum values of the solar magnetic field. Photospheric indices of the solar activity could be useful in long-term studies of the solar magnetic field. (13 refs.)

104824 The problem of field geometry in sunspots. V.Bumba, J.Suda (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.155-61 (June 1983).
Compares the results of older spectroscopic magnetic field and velocity field observations in regular sunspots with the results obtained from white-light and monochromatic photographs of sunspots in the form of three schemes of magnetic field lines of force, velocity vectors and fine structure fibril distribution. The authors obtain the difference between the umbral and penumbral field topology and physical conditions, as well as the uncertainty of the position of bright penumbral fibrils in relation to the magnetic field and radial motion distribution. The possible conclusions of the comparison are briefly discussed. (25 refs.)

104825 RATAN 600 observations on the radio characteristics of the quiet Sun in the range 2-4 cm. V.N.Borovik.
Bull. Spec. Astrophys. Obs.-North Caucasus (USA), vol.13, p.13-23 (1981). Translation of: *Astrofiz. Issled.-Izv. Spets. Astrofiz. Obs. (USSR)*, vol.13, p.17-29 (1981).
Methods and results are presented from studies of the quiet Sun at five wavelengths in the range 2-4 cm performed with the RATAN 600. It is found that the brightness is uniformly distributed over the disk out to 0.95 $R_\odot$. The limb brightening at 4.0 cm is about 10%, but this decreases at shorter wavelengths. The brightness-temperature spectrum at the center of the disk is determined. The brightness temperature falls to half at distances of $1.024R_\odot$ (2.0 cm), $1.029R_\odot$ (2.3 cm), $1.032R_\odot$ (2.7 cm), $1.035R_\odot$ (3.2 cm), $1.052R_\odot$ (4.0 cm) and constitutes correspondingly 400, 550, 700, 1100, and 1500K at a distance of $1.1R_\odot$ from the center. These characteristics indicate a substantially inhomogeneous structure in the transitional layer and the inner corona. (29 refs.)

104826 Magnetic-flux transport by a convecting layer—topological, geometrical and compressible phenomena. W.Arter (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.132, p.25-48 (July 1983).
Numerical calculations by Drobyshevski and Yuferev (1974) of the redistribution of magnetic flux by a Benard layer with cells of square planform have been extended to higher values of electrical conductivity and to other velocity patterns, using a computer code developed for another purpose. Reconnection does not proceed as they supposed, but leads to overall field enhancement, and although the energy is greater at the bottom, there is as much unsigned flux in the upper half as in the lower half of the layer. However, compressible velocity patterns can concentrate flux at their bases. (34 refs.)

104827 Interaction of solar neutrinos with the cosmic background. L.M.Slad' (M.V. Lomonosov State Univ., Moscow, USSR).
JETP Lett. (USA), vol.37, no.2, p.142-5 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.115-18 (20 Jan. 1983).
Annihilation of solar neutrinos by cosmic-background electron anitneutrinos into pairs of axial photons and Compton scattering of cosmic-background axial photons by solar neutrinos can appreciably attenuate the flux of solar neutrinos at the Earth's surface. Starting from the experimental results for ^{37}Cl, predictions are given for the forthcoming experiments for ^{71}Ga and ^{115}In. (11 refs.)

104828 Magnetic flux tubes on the Sun. H.C.Spruit, B.Roberts (Dept. of Appl. Math., Univ. of St. Andrews, St. Andrews, Fife, Scotland).
Nature (GB), vol.304, no.5925, p.401-6 (4 Aug. 1983).
Magnetic fields are the cause of almost all forms of solar activity. Near the solar surface, and possibly in the entire convection zone, these fields occur in

the form of isolated flux tubes. In recent years, new views have been developed (and older ones revived) in which this property plays a central role. These ideas are reviewed dealing with the nature of the solar cycle, sunspot structure, the origin of spicules and the source of mechanical heating in the solar atmosphere. The ideas are illustrated with the aid of a simple mathematical model for the behaviour of thin magnetic flux tubes. The properties of inhomogeneities in the corona (coronal loops) are also discussed. (103 refs.)

104829 Quiet Sun brightness temperature in the millimeter-wavelength range. S.A.Pelyushenko (Radiophys. Sci.-Res. Inst., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.698-702 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.977-82 (Sept. 1982).
Solar brightness temperature measurements available in the literature are recalibrated by comparison with lunar radio radiation, and the radio spectrum of the quiet Sun over the wavelength range 1-20 mm is obtained, with data scattering no greater than ±(3-4)%. (13 refs.)

104830 An estimation of the fluctuations in the extreme limb of the Sun. B.W.Lites (Sacramento Peak Nat. Obs., Sunspot, NM, USA).
Sol. Phys. (Netherlands), vol.85, no.2, p.193-214 (June 1983).
Detailed computations of synthetic solar limb curves are carried out for the purpose of estimating the effects of inhomogeneities in the solar atmosphere upon the observed limb position. Methods of determining the limb position given a solar limb curve are compared. (25 refs.)

104831 Poleward migration of the magnetic neutral line and the reversal of the polar fields on the Sun. I. Period 1945-1981. V.I.Makarov, M.P.Fatianov (Kislovodsk Station of Pulkovo Obs., Kislovodsk, USSR), K.R.Sivaraman.
Sol. Phys. (Netherlands), vol.85, no.2, p.215-26 (June 1983).
Poleward migration of the magnetic neutral line on the Sun has been calculated for the periods 1945-1950 and 1955-1981 using synoptic charts based on Hα observations. Epochs of sign reversal of the solar magnetic field at latitudes 50° to 90° have been determined. During the cycles 19 and 20 a threefold sign reversal took place in the northern hemisphere. (14 refs.)

104832 Poleward migration of the magnetic neutral line and the reversal of the polar fields on the Sun. II. Period 1904-1940. V.I.Makarov (Kislovodsk Station of Pulkovo Obs., Kislovodsk, USSR), K.R.Sivaraman.
Sol. Phys. (Netherlands), vol.85, no.2, p.227-33 (June 1983).
For pt.I see ibid., vol.85, no.2, p.215-26 (1983). Poleward migration of the magnetic neutral line on the Sun has been computed for the period 1904-1940 using synoptic charts based on Hα observations and the epochs of sign reversal of the solar magnetic field at latitudes 50° to 90° have been determined for this period. During the cycles 16 and 14, a threefold sign reversal took place in the northern and southern hemispheres, respectively. (1 ref.)

104833 Broad-band, high-resolution photograph of the solar corona February 16, 1980. K.K.Scaria (Indian Inst. of Astrophys., Bangalore, India).
Sol. Phys. (Netherlands), vol.85, no.2, p.235-6 (June 1983).
Unsharp masking may be used for better reproduction of over-exposed solar corona photographs. (2 refs.)

104834 Network to cell contrast at microwaves. F.C.Drago (Istituto di Astron., Univ. di Firenze, Firenze, Italy), M.R.Kundu, E.J.Schmahl.
Sol. Phys. (Netherlands), vol.85, no.2, p.237-42 (June 1983).
Using different models deduced from EUV lines for the cell and for various network components, the corresponding radio brightness temperature in the millimetric and centimetric range of wavelengths is computed. The contrast $C=[T_b(\text{network})]/[T_b(\text{cell})]$ and the difference $\Delta T=T_b(\text{network})\text{-}T_b(\text{cell})$ are compared with the few available observations of the quiet Sun inhomogeneities performed with sufficient angular resolution. The comparison shows a satisfactory agreement with most of the observations. (10 refs.)

104835 Type I noise storms and the structure of the extreme ultraviolet corona. G.E.Brueckner (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA).
Sol. Phys. (Netherlands), vol.85, no.2, p.243-65 (June 1983).
The spatial fine structure of the solar corona as observed in the EUV line Fe XV is compared with the occurrence of major type I metric noise storms. In all cases, strong changes in the loop structure of the corona are observed. On the disk, these coronal changes are correlated to the emergence of new magnetic flux in the vicinity of existing large active regions. The reverse is demonstrated: during noise storm free periods no coronal changes can be observed. In all cases, reconnection of coronal magnetic fields over large distances is the cause of noise storms rather than changes of magnetic fields within an active region. (7 refs.)

104836 X-ray and microwave observations of active regions. D.F.Webb, J.M.Davis (American Sci. & Engng. Inc., Cambridge, MA, USA), M.R.Kundu, T.Velusamy.
Sol. Phys. (Netherlands), vol.85, no.2, p.267-83 (June 1983).
The authors compare coordinated, high spatial resolution (2-3 arc sec) observations at 6 cm and in soft X-rays with photospheric magnetograms and optical filtergrams of two active regions. The correspondence of the brightest centimetric components in these regions with coronal loops, sunspots and pores, chromospheric structures and the photospheric magnetic field was determined. The principal results are described. (24 refs.)

104837 Spectral analysis of the optical continuum in the 24 April 1981 flare. D.F.Neidig (Air Force Geophys. Lab., Sacramento Peak Obs., Sunspot, NM, USA).
Sol. Phys. (Netherlands), vol.85, no.2, p.285-302 (June 1983).
Spectrograph and multiple-band polarimeter observations of the 24 April 1981 white-light flare indicate the presence of an optical continuum with intensity increasing strongly below 4000 Å. The flare emission (lines and continuum combined) is unpolarized and, at 3600 Å, exceeds the brightness of the background solar surface by 360%. The wavelength dependence of the continuum indicates emission by both negative hydrogen (H^-) and Balmer continuum with the H^- probably originating in the upper photosphere at a height in the range 200-300 km. The observed continuum intensity, if originating at a height of 300 km, implies an energy loss rate of 10^3 erg s^{-1} cm^{-3}. (45 refs.)

104838 Direct measurements of the gradual extreme ultraviolet emission from large solar flares. D.M.Horan, R.W.Kreplin, K.P.Dere (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA).
Sol. Phys. (Netherlands), vol.85, no.2, p.303-12 (June 1983).
Broadband sensors aboard the Naval Research Laboratory's SOLRAD 11 satellites measured solar emission in the 0.5 to 3 Å, 1 to 8 Å, 8 to 20 Å, 100 to 500 Å, 500 to 800 Å, and 700 to 1030 Å bands. Data from sixteen large flares show that the EUV emission is dominated by gradual emission which parallels the soft X-ray emission in duration and magnitude. The data are consistent with the separation of EUV and X-ray flare emission into two distinct components. A persistent component is made up of gradual EUV and gradual soft X-ray emissions. A brief component consists of hard X-rays, impulsive soft X-rays, and impulsive EUV emission. (20 refs.)

104839 Purely coronal flare-like variations. Z.Svestka, J.Schrijver (Space Res. Lab., Astron. Inst., Utrecht, Netherlands), B.Somov, B.R.Dennis, B.E.Woodgate, E.Furst, W.Hirth, L.Klein, A.Raoult.
Sol. Phys. (Netherlands), vol.85, no.2, p.313-37 (June 1983).
A detailed study of the quasi-periodical post-flare variations on November 6, 1980 in X-rays, UV lines, microwaves, and metric waves confirms that these variations were predominantly thermal phenomena and occurred solely in the corona. The authors suggest that the variations were produced in a coronal plasmoid with closed field lines completely detached from the lower atmospheric layers. Reasons are given why such a detached plasmoid can be expected to be formed in the very late phase (some 4-5 hr after the onset) of a major two-ribbon flare. (15 refs.)

104840 Dependence of radio emission in large Hα flares 1967-1970 upon the orientation of the local solar magnetic field. E.C.Roelof, H.W.Dodson, E.R.Hedeman (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).
Sol. Phys. (Netherlands), vol.85, no.2, p.339-49 (June 1983).
During 1967-1970,the greatness of ~90 large flares (Hα importance ≳2) was influenced by the orientation of the large-scale (~100000 km) magnetic field structure over the flare site; the meter-wave-length prompt flux maxima are, on average, an order of magnitude greater for the flares with southward oriented magnetic fields. It is concluded that, during this period, the orientation of the overlying magnetic field affects the amount of electromagnetic flare energy radiated promptly in the corona relative to that radiated in the chromosphere. (12 refs.)

104841 Magnetohydrodynamic simulation of the coronal transient associated with the solar limb flare of 1980, June 29, 18:21 UT. S.T.Wu, S.Wang (Univ. of Alabama, Huntsville, AL, USA), M.Dryer, A.I.Poland, D.G.Sime, C.J.Wolfson, L.E.Orwig, A.Maxwell.
Sol. Phys. (Netherlands), vol.85, no.2, p.351-73 (June 1983).
Soft X-ray data from the XRP experiment on SMM are used to generate the temperature and density in the flaring region of the 1980, June 29 solar flare. The temporal data, together with an assumed velocity, are used to simulate mass injection as the input pulse for the MHD model of Wu et al. (1982, 1983). The spatial and temporal coronal response is compared with the ground-based, Mark III *K*-coronameter observations of the subsequent coronal transient. The simulation produces a spatially-wide, large amplitude, temporarily-steepened MHD wave for either of the two 'canonical' magnetic topologies (closed and open), but no shock wave. (33 refs.)

97.00 STARS

97.10 STELLAR CHARACTERISTICS

104842 A λ 10830 vs. X-ray correlation among late-type stars. M.A.Smith (Sacramento Peak Obs., Sunspot, NM, USA).
Astron. J. (USA), vol.88, no.7, p.1031-3 (July 1983).
Plots of fractional X-ray luminosity versus He I λ 10830 absorption show different behaviors among $F-K$ dwarfs and $G-K$ giants. There is no correlation between these chromospheric parameters for dwarfs, but a rather good one exists for giants. The author infers that coronal EUV photons are dominant in the formation of λ 10830 absorption lines in giant atmospheres and are roughly comparable with electronic collisions in forming λ 10830 in dwarfs. (20 refs.)

104843 Effects of rotation on internal structure of the stars. Z.Kopal (Dept. of Astron., Univ. of Manchester, Manchester, England).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.149-75 (June 1983).
Establishes the explicit form of the equations which govern the internal structure of stars rotating with constant angular velocity formulated in terms of Clairaut coordinates in which the radial coordinate is replaced by the total potential, which for equilibrium configurations remains constant over distorted level surfaces. (47 refs.)

104844 Stellar structures with constant local adiabatic index under extreme relativistic conditions. M.C.Durgapal, A.K.Pande (Dept. of Phys., Kumaun Univ., Nainital, India).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.247-54 (June 1983).
Stellar structures with a constant local adiabatic index Γ discussed under the extreme relativistic condition (dP/dρ=1, at the center of the configuration). The equation of state, $P\alpha\rho_r^{\Gamma}$, where ρ_r is the rest-mass density leads to the relations, (i) $\rho=AP^{1/\Gamma}\text{-}P/(\Gamma\text{-}1)$ between energy density and pressure, and (ii) $e=NP$ between internal energy density and pressure, where the constant N may be called local polytropic index. The local adiabatic index, Γ, is found to be related to the adiabatic index, γ, through a simple relation, $\Gamma=\gamma(1+P/\rho)$. (12 refs.)

104845 Intrinsic polarization and extinction features of early-type stars with emission lines due to X-ray irradiation. J.Svatos (Dept. of Astron. & Astrophys., Charles Univ., Prague, Czechoslovakia).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.267-9 (June 1983).
The explanation of intrinsic polarization and extinction of early-type stars with emission due to X-ray irradiation of silicate grains is given. (11 refs.)

104846 Dissipation of thick accretion disks. A.G.W.Cameron (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.295-303 (June 1983).
A thick accretion disk which is isentropic cannot have simple laminar flow because fluid elements follow orbits which intersect the orbits of other fluid elements, leading to turbulence in astrophysical disks which have very large Reynolds numbers. The turbulence in such disks is estimated using molecular analogies for the behavior of the fluid elements. Characteristic local disk parameters are calculated for a variety of conditions at different distances from a central star of one solar mass. Circumstances involving low midplane

optical depths or external heating which can lead to large reductions in the turbulence are discussed. (5 refs.)

104847 Very massive stars: evolution with mass loss. I. The hydrogen and helium burning phase. J.Klapp (Dept. of Astrophys., Oxford Univ., Oxford, England).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.313-45 (June 1983).
The evolution of mass-losing very massive stars in the 500-10000 $M_\odot$ range has been investigated for two different initial compositions. The evolutionary tracks are governed by two opposing factors which are the increase in the mean molecular weight in the convective core and the effect of mass loss. Conservative evolution of stars with mass $M \ll 10000\ M_\odot$ is similar to that of massive stars (20-100 $M_\odot$), always moving to lower effective temperatures. For low values of the standard mass loss parameter N ($50 \lesssim N \lesssim 200$) the two opposing factors are almost in balance and the star is forced to move in a series of loops. For higher mass loss rates the loops disappear. In the 10000 $M_\odot$ case no loops are observed and the tracks always move to higher effective temperatures. (47 refs.)

104848 An approximate solution to the equation $\epsilon XY(dY/dX)=X-Y(Y+1)$. R.E.Mickens (Dept. of Phys., Atlanta Univ., Atlanta, GA, USA).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.561-4 (July 1983).
Extends the calculations of a previous paper (1978) to include the boundary layer behavior of the solution to the equation $\epsilon XYY'=X-Y(Y+1)$. An iteration technique is used to calculate higher-order corrections to the solution. (7 refs.)

104849 Flux density monitoring of radio stars observable by Hipparcos at S-band and X-band. R.Estalella, J.M.Paredes (Dept. de Fisica de la Tierra y del Cosmos, Univ. de Barcelona, Barcelona, Spain), A.Rius.
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.309-12 (Aug. 1983).
Single-dish simultaneous S-band (13 cm) and X-band (3.6 cm) flux density measurements of radio stars are reported. The aim of the observational program is to monitor the variability and flux density of radio stars with an optical counterpart observable by the future astrometric satellite Hipparcos. From a list of 69 selected radio stars for astrometric purposes, 49 of them have been observed during 1982 with the 64 m antenna of the Madrid DSCC. The number of radio stars that have been detected is 15. (25 refs.)

104850 Star formation within OB subgroups: implosion by multiple sources. R.I.Klein (Lawrence Livermore Nat. Lab., Univ. of California, Berkeley, CA, USA), M.T.Sandford,II, R.W.Whitaker.
Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L69-73 (15 Aug. 1983).
Presents the results of new detailed two-dimensional radiation-hydrodynamical calculations of the effects of radiation-driven shock waves from two O stars on inhomogeneities embedded in molecular clouds. Inhomogeneities that are compressed in this manner by stars in the range O7-B0 survive ionization evaporation and may form new stars. Low-mass objects would not survive, and there would be a natural cutoff of low-mass and high-mass stars. The authors present a scenario for hierarchical radiation-driven implosion as a mechanism for star formation that may explain aspects of new star formation in ultracompact H II regions. (7 refs.)

104851 Stellar spectrophotometric atlas, $3130<\lambda<10800$ Å. J.E.Gunn (Princeton Univ. Obs., Princeton, NJ, USA), L.L.Stryker.
Astrophys. J. Suppl. Ser. (USA), vol.52, no.2, p.121-53 (June 1983).
A spectrophotometric catalog of 175 stars covering a complete range of spectral types and luminosity classes is presented. The Oke multichannel scanner was used to obtain the energy distributions over the wavelength region $3130<\lambda<10800$ Å. Broad-band and Stromgren colors are computed from the scanner data, and these are compared with published photoelectric observations. The catalog is available on magnetic tape. (27 refs.)

104852 Nuclear β-decays of highly ionized heavy atoms in stellar interiors. K.Takahashi, K.Yokoi (Inst. fur Kernphys., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.578-98 (15 Aug. 1983).
β-transition processes of heavy nuclei in stellar interiors are re-investigated. First, the relative abundances of ions in thermal equilibrium for given temperature, density and chemical composition are determined by solving the Saha ionization equation with the simultaneous inclusion of the continuum depression evaluated from a finite-temperature Thomas-Fermi model. Next, β-transitions in the equilibrated matter are studied. The numerical results for some selected examples demonstrate the need for such an involved treatment of β-decays (and particularly of bound-state β^- decays and orbital-electron captures) of certain nuclei of astrophysical importance. (54 refs.)

104853 A model of accretion of small bodies onto a binary system. P.Artymowicz.
Postepy Astron. (Poland), vol.31, no.1, p.19-34 (Jan.-March 1983). In Polish.
A numerical model of the accretion of matter falling from an outer, flattened accretion cloud onto a binary system with given masses and geometrical parameters is presented. The accretion processes is sensitive to the mass ratio of the two components of the system and the orbital angular momentum of the infalling matter. The main result is the observation of the mass-equalizing effect of accretion: the less massive component can accrete more matter than the more massive one. (9 refs.)

97.20 NORMAL STARS (BY CLASS): GENERAL OR INDIVIDUAL

104854 Additional *UBVRI* and *JHKL* photometry of T Tauri stars in the Taurus region. A.E.Rydgren (Dept. of Phys., Rensselaer Polytech. Inst., Troy, NY, USA), F.J.Vrba.
Astron. J. (USA), vol.88, no.7, p.1017-26 (July 1983).
The authors present nearly simultaneous *UBVRI* and *JHKL* photometry for 21 T Tauri stars in the Taurus region and three stars in northern Orion. Some nonsimultaneous *UBVRI* and *JHKL* photometry of T Tauri stars in the Taurus and NGC 2264 regions is also given. These new data reinforce the conclusion from Rydgren, Schmelz, and Vrba (1982) that the T Tauri loci in the $(J-H,\ H-K)$ and $(H-K,\ K-L)$ diagrams are relatively narrow, implying a limited range in maximum temperature for the associated circumstellar dust. From an analysis of the available data for five actively variable T Tauri stars the authors find that (1) the slopes $d(B-V)/dV$ and $d(V-I)/dV$ differ significantly between stars, (2) the $J-H$, $H-K$, and $K-L$ colors tend to become larger when the star is fainter at V, and (3) the amplitude of variations at L is much smaller than the amplitude at V. The resulting constraints on models for T Tauri variability are considered. (35 refs.)

104855 New spectral types for white dwarfs previously thought to be of class DC. G.Wegner (Dept. of Phys. & Astron., Dartmouth Coll., Hanover, NH, USA).
Astron. J. (USA), vol.88, no.7, p.1034-7 (July 1983).
The visual spectra of 18 white dwarfs previously given spectral type DC have been reexamined using the image intensified dissector scanner on the Kitt Peak 2.1-m telescope. With this new high signal-to-noise data, only eight stars remain classified DC, while two are cool narrow lined DA, three appear as cool DB, two show evidence of the Swan bands of the C_2 molecule, and one may have an unidentified feature near λ 5000. The remaining object is of a new variety, hitherto unreported, that has its spectrum dominated by C I lines. (30 refs.)

104856 Astrometry of the low-luminosity stars VB8 and VB10. R.S.Harrington, V.V.Kallarakal (US Naval Obs., Washington, DC, USA), C.C.Dahn.
Astron. J. (USA), vol.88, no.7, p.1038-9 (July 1983).
The very low luminosity stars VB8 and VB10 have absolute parallaxes of $0.154'' \pm 0.006''$ and $0.174'' \pm 0.005''$, respectively, and they each apparently have an unseen companion, either or both of which could have masses of a few milli-Suns. (6 refs.)

104857 The loss of magnetic flux from pre-main sequence stars. D.Moss (Math. Dept., Manchester Univ., Manchester, England).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.213-16 (June 1983).
In response to a paper by Piddington (1982), a mechanism of magnetic flux loss from largely convective stellar models is explicitly demonstrated. (9 refs.)

104858 Nineteen new spectroscopic binaries and the rate of binary stars among F-M supergiants. G.Burki, M.Mayor (Obs. de Geneve, Sauverny, Switzerland).
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.256-66 (Aug. 1983).
Radial velocity measurements obtained with the spectrophotometer CORAVEL on 181 northern F-M supergiants are analyzed. Nineteen new spectroscopic binaries are discovered. Orbital elements are derived for 6 of them. A partial radial velocity curve is given for the 13 others, as also for 3 already suspected or known SB. In addition, 16 other supergiants are suspected to be SB. The rate of SB among northern F-M supergiants is discussed. The study of the binary F-M supergiants with known orbital elements shows that all the systems with a period smaller than a critical value, P_{circ}, have a nearly circular orbit. The value of P_{circ} depends on the luminosity class. This circularization of the orbits results probably from the transfer of angular momentum during the phase of binary mass exchange. (44 refs.)

104859 RGU photometry and Population II stars. F.Thevenin (LAM, Obs. de Meudon, Meudon, France), A.Spaenhauer, R.Foy.
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.331-3 (Aug. 1983).
Preliminary results on the calibration of the RGU photometric system in terms of atmospheric physical parameters are presented. Six stars with $\delta(U-G)$ excess are studied in three different fields: SA54, SA57, and M35. They are found metal deficient, in the range $-0.6 \leq [M/H]_{\odot}{}^{*} \leq -2.5$. These results are consistent with the calibration of the RGU photometry based on synthetic spectra. (22 refs.)

104860 Nickel overabundances in extremely metal-deficient red giants. R.E.Luck, H.E.Bond (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA).
Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L75-8 (15 Aug. 1983).
The authors have carried out local thermodynamic equilibrium model-atmosphere abundance analyses of 37 metal-poor ($-3.0<[\mathrm{Fe/H}]<-0.6$) field red-giant stars on the basis of high-dispersion echelle spectrograms. Nickel has been found to be overabundant in all stars with $[\mathrm{Fe/H}]<-1.8$; for the most metal-deficient star in the sample, $[\mathrm{Ni/Fe}]=+0.8$. The elements in extreme Population II stars were probably synthesized in very massive Type II supernovae. Therefore, these results imply that such supernovae eject material with a much higher Ni/Fe ratio than do the less massive and more typical supernovae that made the elements in the solar system and young stars. (20 refs.)

104861 The discovery of a hot stellar wind. R.L.White (Space Telescope Sci. Inst., Baltimore, MD, USA), R.H.Becker.
Astrophys. J. Lett. Ed. (USA), vol.272, no.1, pt.2, p.L19-23 (1 Sept. 1983).
High-resolution 6 cm observations of two early-type stars have been made with the very large array. Cyg OB2 No.12 appears to have a normal wind with a temperature of about 5000K; Cyg OB2 No.9 has unusual and unexpected radio properties which imply that its radio-emitting circumstellar gas is hotter than 300000K. 97.30 VARIABLE AND PECULIAR STARS

(inc. novae)

104862 The metal abundances of RR lyrae stars in the globular clusters NGC 3201, NGC 4590, and NGC 6171. H.A.Smith (Dept. of Phys. & Astron., Michigan State Univ., East Lansing, MI, USA), A.Manduca.
Astron. J. (USA), vol.88, no.7, p.982-4 (July 1983).
The ΔS metal abundance index has been measured for RR Lyrae stars in the globular clusters NGC 3201, NGC 4590, and NGC 6171. The abundance of NGC 3201 was found to be $[\mathrm{Fe/H}]=-1.33 \pm 0.15$ on Butler's scale, with no evidence of star-to-star variation among nine stars studied. The results for NGC 4590 and NGC 6171 (two stars each) were $[\mathrm{Fe/H}]=-1.96$ and -0.84, respectively. The result for NGC 6171 is in good agreement with previous ΔS determinations. (21 refs.)

104863 Intermediate band and (*R,I*) observations of long-period Cepheids. O.J.Eggen (Cerro Tololo Inter-American Obs., La Serena, Chile).
Astron. J. (USA), vol.88, no.7, p.998-1013 (July 1983).
Intermediate band and (R,I) observations of most of the known southern long-period Cepheids, brighter than about visual magnitude 10 at maximum, and a few northern variables, are presented. (8 refs.)

104864 VLA observations of MWC 349 at 15 and 23 GHz. J.W.Dreher (Dept. of Phys., MIT, Cambridge, MA, USA), W.J.Welch.
Astron. J. (USA), vol.88, no.7, p.1014-16 (July 1983).
The dense stellar wind surrounding the peculiar star MWC 349 was mapped with a resolution of $\sim 0.4'' \times 0.1''$. The r^{-2} density profile suggested by Olnon (1975) fits the maps very well. The fluxes when combined with previously published data indicate a good fit to the spectrum by a power law with $\alpha=+0.65$. If the distance to MWC 349 is 2.1 kpc, then the mass loss rate is $3 \times 10^{-5}\ M_{\odot}\ \mathrm{yr}^{-1}$. (17 refs.)

104865 Light variations of Be stars. I. R.Hirata.
Astron. Her. (Japan), vol.76, no.4, p.100-3 (1983). In Japanese.
Describes B-type emission line stars, photometric variability as revealed by UBV studies, colour-magnitude diagram techniques of analysing Be subgroups, and polarisation phenomena. (no refs.) *M.J.C.*

104866 Stellar activity and the period gap in cataclysmic variables. H.C.Spruit, H.Ritter (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Astrophys., Garching, Munchen, Germany).
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.267-72 (Aug. 1983).
The possibility is investigated that the period gap in cataclysmic variables is related to the sudden decrease in magnetic activity observed in main sequence stars at $B\text{-}V \approx 1.65$. To this end the authors calculate the evolution of a cataclysmic binary under the assumption that the angular momentum loss is due primarily to a magnetic wind from the secondary. It is found that a decrease in the angular momentum loss rate, at the point where the secondary becomes fully convective, can switch off the mass transfer temporarily. A period gap of the right width and location is obtained if certain conditions are met. (31 refs.)

104867 Can shell phases of Be stars be predicted on the basis of rapid spectroscopic micro-variability?. D.Baade (European Southern Obs., Garching Munchen, Germany).
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.283-6 (Aug. 1983).
High resolution high signal-to-noise observations show significant spectroscopic variations of ηCen on a timescale of hours. The observing frequency is not sufficient to decide if the variations are periodic. In June 1982, ηCen was observed outside a shell phase, but at the bottom of Hβ a very faint, rapidly variable emission feature was detected. This is reminiscent of Doazan's (1975) observations of o And during its intershell phase of 1973, shortly before new shell lines became visible. The observations of ηCen are interpreted as further evidence that rapid variability is the variability of the central star. It is speculated that the rapid variability of the faint central emission line is directly related to the ejection of matter into a circumstellar envelope. (32 refs.)

104868 BD Pavonis: a unique cataclysmic variable. H.Barwig, R.Schoembs (Univ.-Sternwarte Munchen, Munchen, Germany).
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.287-93 (Aug. 1983).
High speed multicolour photometry and spectroscopy of BDPav are presented. The object had been classified as a nova. A rediscussion of the eruption however suggests that BDPav more likely is a dwarf nova with rare outbursts. The light curves in quiescence show a sharp eclipse feature, flickering activity, periodic WUMa like variations in *B*, *V*, *R*, and a typical U Gem hump light curve in *U*. The orbital period is 4.3^{h}, for which BDPav is unusually red (G0-G5). Light and colour variations of 0.5 and 0.1 mag, respectively occur during the cycle. The spectra mainly show Balmer emission lines with complex profiles and occasionally He-emission. Radial velocity variations up to 600 mks^{-1} are found. (11 refs.)

104869 Speckle interferometry of IRC+10216 in the fundamental vibration-rotation lines of CO. H.M.Dyck (Inst. for Astron., Univ. of Hawaii, Honolulu, HI, USA), S.Beckwith, B.Zuckerman.
Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L79-83 (15 Aug. 1983).
Measurements have been made of the spatial distribution of five fundamental vibration-rotation lines of ^{12}CO and ^{13}CO in the carbon star IRC+10216 by combining high angular ($1''$) and spectral (45 km s^{-1}) resolution. All five lines were spatially resolved and found to be larger in size than the stellar continuum radiation at the same wavelengths. (14 refs.)

104870 Bright, rapid, highly polarized radio spikes from the M dwarf AD Leonis. K.R.Lang (Dept. of Phys., Tufts Univ., Medford, MA, USA), J.Bookbinder, L.Golub, M.M.Davis.
Astrophys. J. Lett. Ed. (USA), vol.272, no.1, pt.2, p.L15-18 (1 Sept. 1983).
Observes a radio burst from the main-sequence (dM4.5e) star AD Leo at 1400 MHz from 0536 to 0556 UT on 1983 February 1 at the Arecibo Observatory. A rapid sequence of highly polarized spikes was observed during the gradual rise of a longer lasting event. The maximum flux density of the spikes was $S_{\max}=130$ mJy, and they had rise times $\tau \lesssim 200$ ms. The spikes were all 100% left-hand circularly polarized with an instrumental uncertainty of 5%. The rise times provide an upper limit to the linear size $L \lesssim 6 \times 10^{9}$ cm for the emitter. Provided that the source is symmetric, it has an area that is less than 0.03 of the star's surface area. In this case, the lower limit to the brightness temperature of the spikes is $T_{\mathrm{B}} \gtrsim 10^{13}$K. The high brightness temperatures and high degrees of circular polarization are explained. (17 refs.)

104871 Pulsational constraints on the mass and luminosity of R Coronae Borealis stars. H.Saio, J.C.Wheeler (Dept. of Astron., Univ. of Texas, Austin, TX, USA).
Astrophys. J. Lett. Ed. (USA), vol.272, no.1, pt.2, p.L25-8 (1 Sept. 1983).
Allowed ranges of mass and luminosity are given for two pulsating R Coronae Borealis stars, R CrB and RY Sgr. The bounds are set by new theoretical analysis of linear nonadiabatic radial pulsations, by published results for the evolution of helium stars, and by atmospheric parameters derived from spectroscopic analysis. The allowed values are $0.9 \lesssim M/M_{\odot} \lesssim 3$ and $4.2 \lesssim \log(L/L_{\odot}) \lesssim 4.7$ for R CrB and $0.8 \lesssim M/M_{\odot} \lesssim 3$ and $4.1 \lesssim \log(L/L_{\odot}) \lesssim 4.8$ for RY Sgr. (19 refs.)

104872 Photoelectric *UBV* photometry of southern and equatorial dwarf novae. N.Vogt (Univ.-Sternwarte Munchen, Munchen, Germany).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.21-7 (July 1983).
323 *UBV* measurements of 32 dwarf novae and 2 nova-like variables ($\delta \leq +26°$) are listed. The observations were obtained between 1970 and 1979 at the European Southern Observatory, La Silla, Chile. Two supposed dwarf novae (SW Crt and V735 Sgr) probably are not cataclysmic variables. (97 refs.)

104873 Period determination of the Delta Scuti star HR 5005. J.H.Pena, R.Peniche, S.F.Gonzalez (Inst. de Astron., Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.81-4 (July 1983).
Differential photoelectric photometry of the delta Scuti star HR 5005 is presented. By means of a periodogram analysis and least square fitting to periodic functions the frequencies of pulsation 8.606 c/d and 9.208 c/d were found. These frequencies have a ratio that is not consistent with the radial mode of pulsation. (12 refs.)

104874 Determination of radii of Cepheids. II. Radial velocities and dimensions of AD Gem. M.Imbert (Obs. de Marseille, Marseille, France).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.85-9 (July 1983).
In French.
The classical Cepheid AD Geminorum has been observed with the 'Coravel' radial velocity spectrometer. The radius was determined from 38 accurate velocities and from the UBV measurements of Mitchell et al., (1964), Takase (1969) and Szabados (1977). The radius is found to be $35.6 \pm 0.6\ R_{\odot}$, which is compatible with the most recent period-radius relations. (9 refs.)

104875 Infrared magnitudes (JHKLM) for 105 chemically peculiar A and B-stars. D.Groote (Hamburger Sternwarte, Hamburg, Germany), J.P.Kaufmann.
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.91-6 (July 1983).
For 105 Bp- and Ap-stars 410 photoelectrical measurements in 5 spectral bands (JHKLM) from 1.25 μm to 4.8 μm are presented. These measurements were collected in three observation periods. The observations, reductions and errors are discussed in detail. In addition the IR-excess is given for the brightest *M*-measurements. (6 refs.)

104876 Correlations and periodicities of equivalent widths in SS 433. A.Vittone (Capodimonte Astron. Obs., Napoli, Italy), L.Rusconi, G.Sedmak, A.Mammano, F.Ciatti.
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.109-17 (July 1983).
Spectrograms of SS 433 (=V1343 Aquilae) obtained during the years 1978-81 have been reduced from density to exposure through the ELSPEC package. In the calibrated spectra relevant parameters have been deduced for the emission lines in both the rest and moving systems. A list of equivalent widths is presented for these features, indicating a large range of erratic variability during the same night. Hα and other lines are shown to change through the precessional period of 163 days. On the other hand no definite trend is observed through the 13.08^{d} orbital period, nor through the 6.28^{d} modulation period. (21 refs.)

104877 Light variations of the Am star 32 Vir. C.Bartolini, F.Grilli, G.Parmeggiani, A.Piccioni, P.Silveri (Dipartimento di Astron., Bologna, Italy).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.139-55 (July 1983).
Photoelectric observations of the spectroscopic binary and Am star 32 Vir which extended over a time interval of four years show that this star is pulsating with a strongly variable amplitude. Frequency analysis shows that the period $P=0.07188^{d}$ has the highest amplitude and is constant. A second, still fairly uncertain period seems to indicate a radial mode of oscillation. Between the two proposed models: primary or secondary pulsating, the first one seems to be preferable. (26 refs.)

104878 Flare stars in the region around γ Cygni. K.P.Tsvetkova (Dept. of Astron., Bulgarian Acad. of Sci., Sofia, Bulgaria), V.V.Hambarian, G.H.Brutian.
Inf. Bull. Variable Stars (Hungary), no.2365, p.1 (7 July 1983).
Two new flare stars have been discovered near γ Cygni. The authors report approximate positions and photographic magnitudes for these stars, together with the dates and the amplitudes of the observed flares. (no refs.)

104879 Light and radial velocity variations of HR 6127. J.Ziznovsky (Astron. Inst., Slovak Acad. of Sci., Prague, Czechoslovakia).
Inf. Bull. Variable Stars (Hungary), no.2366, p.1-2 (8 July 1983).
Reports photometric observations of the chemically peculiar star HR 6127 (A2p) between December 1981 and July 1982. Light variations were observed with an amplitude of 0.017 mag. and a period of 2.144202 days. Radial velocities were measured for the Ca II K line, and velocity variations were observed with P=2.144039 days and ΔV=5.6 km/s. The minimum of the radial velocity curve occurs at phase 0.1 following the minimum of the light curve. (1 ref.)

104880 Light variability of Nova Delphini 1967 in 1981 and 1982. H.-M.Steinbach, L.Kohoutek (Hamburger Sternwarte, Hamburg, Germany).
Inf. Bull. Variable Stars (Hungary), no.2367, p.1-3 (11 July 1983).
The authors report photometric observations of Nova Delphini 1967 (HR Delphini) between August and October 1981 and during July 1982. Five times of light maximum are reported. The most probable period of the light variations is 0.21231 days. The semi-amplitude of the light curve is decreasing; and the mean brightness of the star is apparently also decreasing. (5 refs.)

104881 Confirmation of the 6 minute period for 21 Com. R.Garrido (Inst. de Astrofisica de Andalucia, Granada, Spain), A.Sanchez-Lavega.
Inf. Bull. Variable Stars (Hungary), no.2368, p.1-2 (12 July 1983).
The authors report photometric observations of the Ap star 21 Comae Berenicis during April 1983. Light variations are observed with periods of about 6 minutes and 24 minutes (frequencies of 244 and 60 c/d respectively). (3 refs.)

104882 Variable star discovered near δ Sagittarii. K.A.Gloria (Maria Mitchell Obs., Nantucket, MA, USA).
Inf. Bull. Variable Stars (Hungary), no.2369, p.1 (13 July 1983).
Reports the discovery of a previously uncatalogued long period variable star at $\alpha=18^{h}14^{m}23^{s}$, $\delta=-29°54.2'$ (equinox 1900.0), southwest of δ Sagittarii. The period of light variation is 230.5 ± 0.5 days, and the epoch of maximum is JD 2433474. The photographic magnitude at maximum light is 13.8; at minimum the star is fainter than magnitude 16.0. (no refs.)

104883 BD+43°1894, a new delta Scuti star. F.Agerer, M.Fernandes, P.Frank (BAV, Berlin, Germany).
Inf. Bull. Variable Stars (Hungary), no.2370, p.1-2 (13 July 1983).
It is reported that BD+43°1894, which has been used as a comparison star for UU Lyncis, is itself a rapid small-amplitude variable star. Photoelectric and photographic observations between January and May 1983 are reported. The star varies between photovisual magnitudes 10.86 and 11.08 with a period of 0.097949 days; the light curve is almost sinusoidal and the period seems to be somewhat variable. (no refs.)

104884 Photoelectric photometry of Ap stars in IC 2602, NGC 6281 and in the Scorpio-Centaurus group: preliminary results. P.North (Inst. d'Astron., Univ. de Lausanne, Lausanne, Switzerland), C.Waelkens.
Inf. Bull. Variable Stars (Hungary), no.2372, p.1-6 (22 July 1983).
New photometric periods have been obtained for stars and for one He-weak star which are members of clusters and associations. (7 refs.)

104885 S 10807 Boo—a new RR Lyrae star. S.Rossiger (Sternwarte Sonneberg Zentralinst. fur Astrophys., Akad. der Wissenschaften, Berlin, Germany).
Inf. Bull. Variable Stars (Hungary), no.2373, p.1 (22 July 1983).
Reports photoelectric observations of the variable star S 10807 Bootis ($\alpha=14^{h}51.8^{m}$, $\delta=+15°50'$, equinox 1950.0) during 1981 and 1983. The star is found to be an RRc-type variable with P=0.281879 days and ΔV=0.6 mag. (1 ref.)

104886 Search for variability of the Sr-Cr-Eu star HD 8783. H.M.Maitzen (Inst. fur Astron., Univ. Wien, Wien, Austria), H.Schneider.
Inf. Bull. Variable Stars (Hungary), no.2374, p.1-2 (25 July 1983).
The authors report uvby photometry of the Ap star HD 8783 between November 1981 and December 1982. No light variations were found. It is pointed out that this lack of variation is rather strange, since the Δa index of this star is definitely variable, with a period of about 1 day or 20 days. It is also reported that one of the comparison stars, HD 8781 (F0 II-III), is a short period variable. (3 refs.)

104887 A study of the magnetic star HD 215441. I. Yu.V.Glagolevskii, K.I.Kozlova, R.N.Kumaigorodskaya, V.S.Lebedev, I.I.Romanyuk, N.M.Chunakova.
Bull. Spec. Astrophys. Obs.-North Caucasus (USA), vol.13, p.1-4 (1981). Translation of: *Astrofiz. Issled.-Izv. Spets. Astrofiz. Obs. (USSR)*, vol.13, p.3-7 (1981).
Four spectra are examined for the magnetic star HD 215441 as recorded with a Zeeman circular-polarization analyzer with the 6-meter telescope (dispersion 9 Å/mm) in phase 0.87. The inclination of the axis of rotation to the line of sight and the angle between the axis of rotation and the axis of the dipole are calculated. Unno's method is used in calculating the theoretical profiles. It is found that the magnetic field is closely represented by a central dipole. The measured H_γ profiles are used with the Mihales (1972) theoretical profiles to determine the effective temperature and log g. The growth curve constructed from Ti II, Fe II and Cr II lines gives T_e. The average value of T_e derived from these estimates and published data is $T_e=14600K$. (13 refs.)

104888 A search for lines of heavy elements in the 3170-3700 Å region for the Ap stars 21 Per, 53 Cam, and β CrB. Yu.V.Glagolevskii, K.I.Kozlova.
Bull. Spec. Astrophys. Obs.-North Caucasus (USA), vol.13, p.5-8 (1981). Translation of: *Astrofiz. Issled.-Izv. Spets. Astrofiz. Obs. (USSR)*, vol.13, p.8-11 (1981).
Ultraviolet spectra are examined with a dispersion of 6.7 Å/mm in the region λ 3160-3700 Å for the magnetic stars 21 Per, 53 Cam, β CrB in order to locate the lines of heavy elements with $Z>74$. Spectra were recorded with the principal stellar spectrograph on the 6-meter telescope. The faintest observable line has an equivalent width of 7-9 mÅ. The numerous lines from various elements include from one to several lines of certain elements as a rule with relatively low reliability. All the other lines coincide with those of elements usually present and cannot be distinguished reliably. (13 refs.)

104889 A search for rapid variability in magnetic stars from the core of the H_γ hydrogen line. Yu.V.Glagolevskii, I.I.Romanyuk, V.G.Shtol, V.D.Bychkov.
Bull. Spec. Astrophys. Obs.-North Caucasus (USA), vol.13, p.9-12 (1981). Translation of: *Astrofiz. Issled.-Izv. Spets. Astrofiz. Obs. (USSR)*, vol.13, p.12-16 (1981).
The Zeiss 600 telescope has been used with a UAGS spectrograph equipped with a photoelectric attachment to examine two peculiar stars (α And and 53 Cam) in a search for short-term intensity variations in the central part of the H_γ line. The width of the photometered region was 10 Å. The measurements were made relative to comparison stars and in one case (α And) relative to part of the continuum from the star itself. It is found that α And shows no intensity variation exceeding 0.6% while that for 53 Cam does not exceed 2.5%. (3 refs.)

104890 GK Persei. M.G.Watson, A.Smith.
I.A.U. Circ. (USA), no.3850, 1 pp. (12 Aug. 1983).
The authors report the discovery of a 351-second X-ray periodicity in GK Persei (Nova Persei 1901). This modulation was discovered as a result of observations by EXOSAT on 1983 August 9. In addition it is reported that the mean 2 to 10 keV flux at this time was about 7 μJy, indicating an X-ray brightening correlated with the current optical outburst. (2 refs.)

104891 Nova Muscae 1983. E.Budding.
I.A.U. Circ. (USA), no.3853, 1 pp. (17 Aug. 1983).
Reports UBV photometry for the period 1983 January 22 to February 5. Minor brightness fluctuations were noted within minutes on February 5. (no refs.)

104892 Variable star in Ara. W.Liller.
I.A.U. Circ. (USA), no.3853, 1 pp. (17 Aug. 1983).
Spectroscopic observations of the newly-discovered variable star in late July 1983 show strong TiO bands characteristic of a very cool long-period variable. (3 refs.)

104893 Novalike object in Libra. J.Maza.
I.A.U. Circ. (USA), no.3854, 1 pp. (22 Aug. 1983).
Reports the discovery on 1983 August 10 of a 9th-magnitude novalike object at $\alpha=15^h16^m58.03^s$, $\delta=-24°49'35.7''$ (equinox 1950.0). The object was fainter than $m_{pg}=18$ on 1983 July 13 and on many earlier plates. (no refs.)

104894 GK Persei. J.Mattei.
I.A.U. Circ. (USA), no.3848, 1 pp. (5 Aug. 1983).
Visual magnitude estimates are reported for the period 1983 July 21 to 25. (1 ref.)

97.60 LATE STAGES OF STELLAR EVOLUTION
(inc. black holes)

104895 Accretion disk stories. I. Observational aspects. J.Fukue.
Astron. Her. (Japan), vol.76, no.4, p.92-5 (1983). In Japanese.
Considers thin accretion disks surrounding black hole/neutron star/white dwarf/main-sequence star combinations as well as thick accretion disks with jets. The nucleus of our Galaxy, cataclysmic binaries, and contact binary systems are also described. (no refs.) *M.J.C.*

On the collapse of neutron stars and stellar cores to pion-condensed stars .... See Entry 104903

97.60B Supernovae

104896 Supernova in NGC 5746. R.P.Kirshner.
I.A.U. Circ. (USA), no.3854, 1 pp. (22 Aug. 1983).
It is reported that spectroscopic observations on 1983 August 5 show that this object is a type I supernova which was then roughly one month past maximum. (1 ref.)

104897 Electron capture rates during collapse of the supernova core. A.Zaringhalam (Niels Bohr Inst., Copenhagen, Denmark).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.599-610 (15 Aug. 1983).
Electron capture rates in the core of a collapsing star are calculated. It is shown that allowed Gamow-Teller transitions are quickly suppressed and that the neutronization rates are dominated by first forbidden transitions. These rates are evaluated using a simple model of the nucleus. In the calculation of the total neutronization rates, the contribution of free protons is also included. Comparison shows that early investigators overestimated the rates by a factor of ~20. (11 refs.)

97.60G Pulsars

104898 Discovery of a 6.1-ms binary pulsar PSR 1953+29. V.Boriakoff (Nat. Astron. & Ionosphere Center, Cornell Univ., Ithaca, NY, USA), R.Buccheri, F.Fauci.
Nature (GB), vol.304, no.5925, p.417-19 (4 Aug. 1983).
A systematic search for fast radio pulsars in some of the error boxes of the γ-ray satellite COS B unidentified point sources on the 305-m Arecibo Observatory radiotelescope was started 3 years ago. One of the search areas covered was the Gg-source 2CG065+00. The discovery is reported of a 6.13317-ms pulsar in a binary system with a 120-day orbital period inside the error box of this source. The initial search observation (23 July 1980) with a sampling rate of 4.167 ms produced an aliased (76.93 Hz) detection at 430 MHz. Confirmatory observations made in March 1983, showed a variable pulse frequency indicating a Doppler shift due to a periodic orbit around another object. A compilation of measured system parameters and the underlying assumptions are given. (12 refs.)

104899 On the origin of the 6.1-ms pulsar. P.C.Joss, S.A.Rappaport (Dept. of Phys., MIT, Cambridge, MA, USA).
Nature (GB), vol.304, no.5925, p.419-21 (4 Aug. 1983).
PSR 1953+29 is in a binary system with an unseen companion: its orbital period, P_{orb}, is ~120 days, its projected semi-major axis, $a_p\sin i$, is $\sim9\times10^{11}$ cm, and its orbital eccentricity, e, is small. A model for the origin and evolution of this binary system is presented that quantitatively accounts for all of its salient features. The evolutionary scenario begins with a luminous binary X-ray source composed of a neutron star and a lower giant-branch companion and terminates when the system has evolved into its present configuration and the companion has become a low-mass degenerate dwarf. This model can explain both the large separation of the binary and the approximate circularity of the orbit despite the large separation relative to the present sizes of the component stars. (18 refs.)

104900 Evolutionary history of the 6.1-ms pulsar. B.Paczynski (Princeton Univ. Obs., Princeton, NJ, USA).
Nature (GB), vol.304, no.5925, p.421-2 (4 Aug. 1983).
The rapid rotation of the pulsar, small mass function, circular orbit, and long binary period suggest that following the formation of a neutron star there had to be a phase of mass transfer from the low-mass secondary onto the neutron star primary. That mass transfer circularized the orbit and spun up the primary, and it required the secondary to be a red giant at that time. The present binary period of 120 days implies that the secondary has a mass of $0.3M_\odot$. The observed mass function of $0.0027M_\odot$ implies that the primary must be less massive than $3.1M_\odot$, not an interesting mass limit for a neutron star. The secondary is probably a white dwarf at present. (9 refs.)

104901 Is the 6-ms binary pulsar the remnant of a bright galactic X-ray source?. G.J.Savonije (Astron. Inst., Univ. of Amsterdam, Amsterdam, Netherlands).
Nature (GB), vol.304, no.5925, p.422-3 (4 Aug. 1983).
It is argued that the recently discovered 6-ms radio pulsar with orbital period $P_b=120\neq4$ days, a sin $i=(0.92\neq0.08)\times10^{12}$ cm and $e\approx0$) is the spun up remnant of a formerly heavily accreting ($\dot{M}\approx10^{-8}M_\odot yr^{-1}$) X-ray source, belonging to a new type of low-mass X-ray binaries. This new type of X-ray binary consists of a critical lobe filling (lower) branch giant star of $\approx1M_\odot$ that spills mass to its neutron star companion. Such systems will end their lives as wide binary systems ($P_b\gtrsim100$ days), consisting of a $\approx0.3M_\odot$ helium white dwarf (the remnant core of the giant) in orbit about a rapidly spinning neutron star. (13 refs.)

104902 X-ray emission and spin-up evolution of the 6.1-ms pulsar. D.J.Helfand, M.A.Ruderman, J.Shaham (Dept. of Phys., Columbia Univ., New York, NY, USA).
Nature (GB), vol.304, no.5925, p.423-5 (4 Aug. 1983).
An upper bound to the X-ray luminosity of PSR 1953+29 of $L_x<4\times10^{32}$ erg s^{-1} is reported. The consequences of this and other observational data for theoretical models of this pulsar's formation and spindown are considered. The two fast pulsars have features in common which suggest a similar genesis (very low magnetic field and surface temperature, low galactic latitude) and it is proposed that both are members of a new class of radio pulsars. (17 refs.)

Fate of very low-mass secondaries in accreting binaries and the 1.5-ms pulsar .... See Entry 104929

97.60J Neutron stars

104903 On the collapse of neutron stars and stellar cores to pion-condensed stars. B.Kampfer (Zentralinst. fur Kernforschung Rossendorf, Dresden, Germany).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.185-97 (June 1983).
The transition from a neutron star to a pion-condensed star is investigated in Newtonian hydrodynamics. It is shown that in a certain range of ultradense equations of state, there occurs a mass ejection with energies comparable with usual supernova outputs. But the ejected mass is only in the order of 0.02 $M_\odot$. Additionally the collapse of a stellar core to a neutron star with pion-condensed core is considered. Further, the possible consequence of pion condensation during the secular evolution of the bounced core of a collapsing star to the cool final neutron star is discussed. (36 refs.)

104904 Quark-abnormal neutron stars. Qu Qinyue, Wang Zhenru, Zhao Jiabing (Dept. of Astron., Nanjing Univ., Nanjing, China).
Sci. Sin. (China), vol.26, no.6, p.650-6 (June 1983).
Using the equation of state given by Freedman and McLerran (1978) for quark state and that given by the authors for abnormal neutron state with abnormal protons, they have explored the models of stars with the interior in quark state and the outer layer in abnormal neutron state. They have arrived at the conclusion that there possibly exist stable quark-abnormal neutron stars. (12 refs.)

97.60L Black holes

104905 A charged black hole in a uniform magnetic field. K.D.Krori, S.Chaudhury, S.Dowerah (Math. Phys. Forum, Cotton Coll., Gauhati, India).
Can. J. Phys. (Canada), vol.61, no.8, p.1192-7 (Aug. 1983).
The authors present an investigation of the event horizon of a charged black hole embedded in a uniform magnetic field by studying the Gaussian curvature. It is shown that the Gauss-Bonnet theorem holds for this magnetized black hole and also for a magnetized Kerr black hole. (15 refs.)

104906 Searching for black holes. D.Crampton, J.B.Hutchings, A.P.Cowley (Dominion Astrophys. Obs., Victoria, BC, Canada).
J. R. Astron. Soc. Can. (Canada), vol.77, no.3, p.103-7 (June 1983).
Continuing observations of X-ray sources have led to the discovery of many neutron stars but few black-hole candidates. A brief account is given of the observations leading to the discovery of the massive unseen object in the LMC X-3 system. (7 refs.)

97.80 BINARY AND MULTIPLE STARS

(inc. extrasolar planetary systems)

104907 A photometric and spectroscopic study of the short-period eclipsing binary BV Eridani. D.Baade (European Southern Obs., Garching, Germany), H.W.Duerbeck, M.T.Karimie, A.Yamasaki.
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.69-77 (June 1983).
UBV observations of the short-period eclipsing binary BV Eri are reported and analyzed. The radial velocity curve is given. The system shows a light curve distortion, making an analysis difficult. The secondary fills its critical Roche lobe. The system seems to be in an interesting evolutionary stage. (9 refs.)

104908 Variable infrared radiation from X-ray sources 4U 0115+634 and A 0535+262. Yu.N.Gnedin, G.V.Khozov, V.M.Larionov (A.E. Ioffe Physico-Tech. Inst., Acad. of Sci., Leningrad, USSR).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.207-11 (June 1983).
Observations of the X-ray binaries 4U 0115+634 and A 0535+262 performed in 1981-2 revealed a significant IR variability of these sources. 4U 0115+634 was observed twice in the periods close to high and low levels of X-ray activity. A 0535+262 ($K \approx 6^m$) showed temporal variations ranging from tens of minutes to some days. The regular variations of IR brightness are suspected in the period close to 104 s, which corresponds to the period of axial rotation of a neutron star in A 0535+262. The results obtained present arguments in favour of the hypothesis that IR radiation is generated near the accreting neutron star and is possible of a maser nature. (11 refs.)

104909 The photometric period of 39 AY Ceti. J.A.Eaton, D.S.Hall, G.W.Henry (Dyer Obs., Vanderbilt Univ., Nashville, TN, USA), J.L.Hopkins, K.Krisciunas, H.J.Landis, H.Louth, E.H.Olsen, T.R.Renner, H.J.Stelzer.
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.271-6 (June 1983).
Photoelectric photometry obtained in 1971 and 1972 is compared with that obtained in 1980-81 and 1981-82 to derive a photometric period of 77.65^d. JD 2444636.0 is an epoch of minimum light. The full amplitude has been as large as 0.18^m in *V*. Curiously, the mean light level has dropped by almost 0.2^m over the last ten years. This binary is additionally interesting because of the recently discovered white dwarf secondary component and because unpublished radial velocity measures of Fekel (1982) show a large (0.1) eccentricity and an orbital period (57.1^d) very different from the authors' photometric period. (19 refs.)

104910 Five years of photometry of σ Geminorum. R.E.Fried (Braeside Obs., Flagstaff, AZ, USA), J.A.Eaton, D.S.Hall, G.W.Henry, C.A.Vaucher, J.L.Hopkins, J.D.Sabia, K.Krisciunas, C.R.Chambliss, H.J.Landis, H.J.Louth, T.G.McFaul, D.R.Skillman, T.R.Renner.
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.305-11 (June 1983).
Five years of photoelectric photometry of this bright K1 III RS CVn binary has been obtained at thirteen different observatories. Except for one year, the light curve has shown two minima, separated by roughly a half cycle. At the epoch of discovery (1977.2) one minimum was shallower but as of 1980.2 the two became comparable in depth. During the 1979-80 season the light curve changed shape rapidly, the shallower minimum becoming as deep as the other within about 80 days or perhaps less. Times of both minima can be fit with a photometric period of 19.423^d, which is 0.9% shorter than the 19.603^d orbital period. The overall brightness range during the five years has been $4.13^m < V < 4.29^m$. (17 refs.)

104911 Intrinsic polarization in β Lyrae and nova T-Pyxidis due to irradiation of silicate glassy grains. J.Svatos (Dept. of Astron. & Astrophys., Charles Univ., Prague, Czechoslovakia).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.347-9 (June 1983).
It is shown that the main mechanism governing the intrinsic polarization in the binary β Lyrae and in nova T-Pyxidis is very probably X and/or UV irradiation of silicate glass-like grains. (13 refs.)

104912 A new computer approach to the modeling of close binary stars. D.Greenspan (Dept. of Maths., Univ. of Texas, Arlington, TX, USA).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.351-76 (June 1983).
A new, *n*-body approach is developed for the modeling of close binary systems, the most commonly occurring star systems known. Both local and long range forces are included. Computer examples of streaming, mass loss, and self-reorganization processes are described and discussed. (19 refs.)

104913 Extensive photometric study of RT Lacertae. Z.Tunca, C.Ibanoglu, O.Tumer, A.Y.Ertan, S.Evren (Ege Univ. Obs., Bornova, Izmir, Turkey).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.431-45 (June 1983).
Presents observations of the peculiar eclipsing binary RT Lac, which were obtained in 1980 and 1981. Examining the light curves obtained in successive years the authors estimate the period of the migrating light curve distortion to be about four years. The orbital period of the system is also found to be decreasing with an amount 34s century^{-1}. The brightnesses both at primary and secondary are changing with the time, which is clearly seen from the last light curves. The variations which occurred at primary are three times greater than secondary eclipse. Therefore, the authors suggest that the star, in front at primary eclipse, is more responsible for the distorted light curves and it should be the earlier spectral type and also the smaller one. (11 refs.)

104914 Optical photometry of massive X-ray binaries: Cen X-3/V779 Cen. J.van Paradijs (Astron. Inst., Univ. of Amsterdam, Amsterdam, Netherlands), J.Lub, J.W.Pel, M.Pakull, S.van Amerongen.
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.294-9 (Aug. 1983).
Presents the results of photometric observations of V779 Cen, the optical counterpart of the massive X-ray binary Cen X-3. Combining these results with previously published data the authors derive an average light curve. This curve shows the customary double-wave shape, with equal maxima and unequal minima, characteristic of ellipsoidal variations of a tidally distorted, gravitationally darkened, primary star. The light curve is shifted, by $\sim$0.015 cycles, with respect to the X-ray ephemeris. Only by stretching the system parameters to their extreme limits can the amplitudes of the light curve be understood as a result of ellipsoidal variations only, and an additional source of light is probably present in this system. It is attractive to identify this light source, with an accretion disk. (45 refs.)

104915 Statistics of binary stars. I. Multivariate analysis of spectroscopic binaries. M.Fofi, C.Maceroni (Osservatorio Astron. di Monte Mario, Roma, Italy), M.Maravalle, P.Paolicchi.
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.313-21 (Aug. 1983).
By multivariate statistical analysis the authors point out correlations among physical parameters of spectroscopic binary systems. The best clustering has been outlined allowing a direct interpretation in terms of HR diagram in the maximum variance plane. Cluster analysis confirms the probable period-eccentricity relation. The existence of a well defined cluster with strongly unbalanced masses supports the hypothesis of an original bimodality in the mass ratio distribution. (38 refs.)

104916 Cygnus X-1: optical variation on the 294 day X-ray period. J.C.Kemp, M.S.Barbour, G.D.Henson, D.J.Kraus, I.G.Nolt, J.V.Radostitz (Dept. of Phys., Univ. of Oregon, Eugene, OR, USA), W.C.Priedhorsky, J.Terrell, E.N.Walker.
Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L65-8 (15 Aug. 1983).
The 294 day X-ray period has optical counterparts. A 10 yr *B* band photometric record shows synchronous changes of 0.01 mag amplitude, with minima coinciding with the X-ray minima. Stronger and weaker variations, respectively, are seen in *U* and *V*. The 5.6 day orbital light curves, additionally, show pronounced changes on the 294 day cycle. There is also a 294 day polarization variation. (9 refs.)

104917 Binaries as a heat source in stellar dynamics: release of binding energy. P.Hut (Inst. for Advanced Study, Princeton, NJ, USA).
Astrophys. J. Lett. Ed. (USA), vol.272, no.1, pt.2, p.L29-33 (1 Sept. 1983).
Binaries play an important role in the energy budge of dense stellar systems, absorbing energy from and injecting energy into a star cluster. Several million binary-single star scattering experiments are carried out numerically to determine quantitatively these heat exchange processes. The results presented confirm and make more specific previous analytic approximations: soft binaries become softer while hard binaries become harder. The transition between these two regimes plays the role of a watershed. For the equal mass case, the velocity of the incoming star at this watershed is found. The average amount of energy exchange is plotted as a function of ν for initial binary eccentricity $e = 0.7$ (the rms value in a thermal distribution). The results can serve as input for models of evolving star systems, in much the same way as nuclear cross sections in models of stellar evolution. (22 refs.)

104918 Mystery star [epsilon Aurigae]. D.Darling.
Astronomy (USA), vol.11, no.8, p.66-71 (Aug. 1983).
Reviews numerous models for this long-period eclipsing binary. July 1982 saw the start of its seventh minimum since the discovery of its variability. Prospects for the study of the dark eclipsing companion are considered. (no refs.)

104919 Light curves and elements of AH Virginis. P.G.Niarchos (Dept. of Astron., Univ. of Athens, Athens, Greece).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.13-19 (July 1983).
The W UMa-type system AH Virginis has been observed in two wavelengths (*V* and *B*) during the years 1977-78. The light curves of the system are analysed using frequency domain techniques and new geometric and photometric elements are given. (21 refs.)

104920 Spectroscopic orbit of the star HR 96. D.P.Hube (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.29-31 (July 1983).
Orbital elements are derived for the first time for the spectroscopic binary HR 96. A relatively long period (48.2905^d), large eccentricity (0.384) and large mass function ($0.107 M_\odot$) are found. No supporting evidence has been found for previously suggested spectroscopic and photometric peculiarities are variability. (7 refs.)

104921 YZ Cassiopeiae and the Utrecht photometric system. A.C.de Landtsheer (Astron. Inst., Utrecht, Netherlands).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.161-75 (July 1983).
Four light curves of YZ Cas measured in the Utrecht photometric system are presented. Interpretation with the programs of Wood, and Wilson and Devinney proves that the physical elements are not dependent on the wavelength of observation. Limb darkening coefficients of the hot component are only

marginally determinable, while the coefficient of the cool component is not recoverable. Accounting for the metallic character of the primary the spectral types (A2 IVm+F5 V) of the components of YZ Cas would now be B9.5 IVm and F1 V. The orbital period of the system is found to be constant and is described by the updated ephemeris: Hel. $JD=2444632.2685+4.4672234$ *E*. (30 refs.)

104922 Micrometric measurements of southern double stars. R.W.Argyle (Royal Greenwich Obs., Hailsham, England).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.177-80 (July 1983).
Micrometric measurements of 111 double stars made with the 26.5 inch refractor at Johannesburg are presented. (1 ref.)

104923 Photoelectric observations of ϵ Aurigae during the ingress.
Inf. Bull. Variable Stars (Hungary), no.2371, p.1-3 (19 July 1983).
Reports UBV magnitudes and light curves of ϵ Aurigae for the period 1982 September 24 to 1983 March 14. Estimated magnitudes at mid-eclipse are also reported. The epoch of second contact is found to be about JD 2445306. (2 refs.)

104924 New photoelectric times of minima of VW Cephei. P.G.Niarchos (Dept. of Astron., Univ. of Athens, Athens, Greece).
Inf. Bull. Variable Stars (Hungary), no.2375, p.1-2 (27 July 1983).
Reports 12 times of light minimum (six primary minima and six secondary minima) for VW Cephei (BD+75°752), obtained by BV photometry between 5 and 11 September 1980. (4 refs.)

104925 Hercules X-1 and MXB 1730−335. Y.Tanaka.
I.A.U. Circ. (USA), no.3852, 1 pp. (17 Aug. 1983).
It is reported that the Tenma satellite observed high and low states of Hercules X-1 during the period 1983 May 20 to June 1. It is also reported that the Rapid X-ray Burster MXB 1730−335 may have become active. The Tenma satellite has observed the persistent X-ray flux and type 1 bursts from this source since 1983 August 5. (2 refs.)

104926 ϵ Aurigae. M.Parthasarathy, D.L.Lambert.
I.A.U. Circ. (USA), no.3848, 1 pp. (5 Aug. 1983).
Observations of ϵ Aurigae during totality show a significant decrease in the strength of the K I 770 nm resonance line and the Na I D-lines. During the same period the Hα line was broad and the emission in the wings of the line disappeared. These observations suggest that the neutral gas is mostly confined to the outer regions of the eclipsing object. (no refs.)

104927 Coude radial velocities of ζ Herculis. C.D.Scarfe, H.Funakawa, P.A.Delaney, D.J.Barlow (Climenhaga Obs., Dept. of Phys., Univ. of Victoria, Victoria, BC, Canada).
J. R. Astron. Soc. Can. (Canada), vol.77, no.3, p.126-41 (June 1983).
Radial velocities of ζ Herculis A have been obtained photographically since 1962. The data are fitted by a Keplerian curve with an r.m.s. residual of 0.23 km s^{-1}. However, the elements obtained from the radial velocities do not agree well with those from visual observations, and a solution combining the visual and spectroscopic data shows systematic trends in the residuals at some phases. Masses are obtained from this solution by adopting either the mass ratio or the parallax of Lippincott (1981); the latter appears to give the more plausible results. The question of a third component is reconsidered, and the one proposed by Baize (1976) is ruled out. (23 refs.)

104928 The double-lined spectroscopic binary HD 28475. D.P.Hube (Dept. of Phys., Univ. of Alberta, Edmonton, Canada).
J. R. Astron. Soc. Can. (Canada), vol.77, no.3, p.142-6 (June 1983).
Orbital elements are computed for the double-lined spectroscopic binary HD28475, including a period of 13.8761^{d}. The system is detached and consists of two unevolved stars of spectral type near B5. (10 refs.)

104929 Fate of very low-mass secondaries in accreting binaries and the 1.5-ms pulsar. M.A.Ruderman, J.Shaham (Dept. of Phys., Columbia Univ., New York, NY, USA).
Nature (GB), vol.304, no.5925, p.425-7 (4 Aug. 1983).
Families of old tight low-mass binaries in which mass transfer to a heavier collapsed primary from a lighter secondary is an essential evolutionary feature include the galactic bulge X-ray sources, in which the primary is a neutron star. Canonical theories for the evolution of such binaries assume that the mass transfer and secondary evolution are always stable. It is argued in this article that the stability postulate may fail if the secondary mass falls below $\sim 2\times10^{-2}\ M_{\odot}$. The secondary may then be almost entirely tidally disrupted, leaving behind, at most, a small remnant very much lighter than the Earth in an orbit with a period of several hours. In binary accretion scenarios for the origin of the millisecond pulsar PSR 1937+214, this could explain the absence of any detected binary companion. (8 refs.)

104930 Average radii, masses and mean densities of stars—components of eclipsing systems. T.Z.Dworak (Komisja Astronomii, Polskiego Towarzystwa Astronautycznego, Krakow, Poland).
Postepy Astron. (Poland), vol.31, no.1, p.53-9 (Jan.-March 1983). In Polish.
Contains average values of radii, masses and mean densities determined for stars of given spectral types and luminosity classes. These values have been calculated on the basis of data from a catalogue of parameters for eclipsing binaries (Brancewicz and Dworak 1980). Results are presented in tables and diagrams. Diagrams which present the radius-mass relation and mass-luminosity relation are given. For the first time the mass-luminosity relation has been determined for subgiants (luminosity class IV). (4 refs.)

104931 The planetary system of Barnard's star. P.van de Kamp.
Vistas Astron. (GB), vol.26, pt.2, p.141-57 (1982).
Analysis of astrometric positions of this nearby red dwarf star, obtained with the Sproul 61-cm photovisual refractor in 44 consecutive years over the interval 1938-81, confirms the orbital interpretation established earlier. The perturbation is attributed to two approximately circular orbits with periods 12 and 20 years and radii 0.0070″ and 0.0064″, caused by invisible companions with 0.7 and 0.5 Jupiter masses respectively. The orbits may be nearly coplanar and co-revolving, thus supporting the notion of a planetary system. (23 refs.)

104932 Properties of young clusters near reflection nebulae. K.Sellgren (California Inst. of Technol., Pasadena, CA, USA).
Astron. J. (USA), vol.88, no.7, p.985-97 (July 1983).
Near-infrared observations in the reflection nebulae NGC 7023, 2023, and 2068 are used to study clusters of young stars found associated with these nebulae. At least 30%-60% of these stars are pre-main-sequence objects, as indicated by their infrared excesses, hydrogen line emission, or irregular variability. The spatial distributions and observed luminosity functions of these young open clusters are derived, and the inferred mass function and star formation efficiencies are discussed. (32 refs.)

104933 Positions, magnitudes, and colors for stars in the globular cluster M92. R.Buonanno, G.Buscema, C.E.Corsi, G.Iannicola, F.Smriglio (Osservatorio Astron. su Monte Mario, Roma, Italy), F.F.Pecci.
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.1-12 (July 1983).
B, *V* magnitudes and relative positions for all the stars brighter than $B=18$, and $V=17.5$ in an annulus ranging from $r=1.5$ arcmin to $r=4.5$ arcmin from the centre of the cluster NGC 6341=M92 have been derived using a reduction procedure applied to digitized photographic data. Moreover, *B*, *V* magnitudes (and positions) for a second sample of stars are given in order to allow a better definition of the main branches in the color magnitude diagram. The accuracy of the data is discussed in detail. (16 refs.)

104934 A physical study of the Ursa Major cluster (with special attention to peculiar A stars). L.O.Loden (Astron. Obs., Uppsala, Sweden).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.33-42 (July 1983).
The investigation aims at a search for some spectral individualities that are characteristic of members of certain clusters or associations. Intermediate-dispersion spectra of 26 A-type stars in the Ursa Major region have been secured. A few of the stars are supposed or suspected to belong to the Ursa Major moving cluster. The material also includes a number of CP stars. Line intensities have been measured for 17 spectral lines representing 11 elements, and average values of these intensities have been scrutinised. The preliminary results indicate that a few particular lines ought to be subject to intensified examination with respect to sensitivity to astrogenetic origin. (32 refs.)

104935 NGC 6256, a galactic globular cluster. G.Alcaino (Inst. Isaac Newton, Min. de Educacion de Chile, Santiago, Chile).
Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.47-55 (July 1983).
A provisional color-magnitude diagram (CMD) is constructed for 182 stars in the magnitude range $13.7<V<18.8$ and $14.5<B<20.0$. It is found that NGC 6256 is a globular cluster. Located in a dense stellar field at low galactic latitude, the cluster has a CMD consisting of a flattened giant branch as well as some red horizontal branch stars typical features of metal rich clusters. The adopted horizontal branch luminosity at $V_{HB}\sim18.2$ and the estimated reddening $E(B-V)=0.80$, place the object at 11.0 kpc from the Sun, 0.6 kpc from the galactic plane and 2.9 kpc from the galactic center. 98.40 INTERSTELLAR MATTER; AND NEBULAE

104936 The galactic extinction of extragalactic objects. I. The csc *b* law and the extinction coefficient. G.de Vaucouleurs, R.Buta (Dept. of Astron., Univ. of Texas, Austin, TX, USA).
Astron. J. (USA), vol.88, no.7, p.939-61 (July 1983).
Galactic extinction models applicable to extragalactic objects and, in particular, the evidence for or against the assumption of zero-extinction windows in the galactic polar caps ($|b|>50°$) are re-examined by five independent methods: (i) counts of faint galaxies from two different data sources (Lick, Palomar); (ii) counts of distant galaxy clusters from two different catalogs (Abell, Zwicky); neither gives any support to the concept of polar windows; both obey closely the csc *b* law, right up to the poles in each galactic hemisphere; (iii) the mean surface brightness m'_{e} within the effective aperture A_{e} of 545 bright galaxies; (iv) the hydrogen-luminosity ratio measured by the H I index newly derived for 463 bright galaxies on the RC2 system; both are consistent with a csc *b* law up to the poles and with an extinction coefficient

in agreement with the value $A_1=0.20$ mag, adopted in RC2; and (v) the total color indices $(B-V)_T$ and $(U-B)_T$ of 830 and 488 bright galaxies give no indication of systematic departures from the RC2 galactic extinction model and the reddening is consistent with the adopted extinction coefficients. Because all tests measure essentially the same quantity, A_B, they can be combined with appropriate scale factors and relative weights. The normalized extinction derived from the combined galaxy and cluster counts (i, ii) verifies very precisely the statistical validity of the csc b law at all $|b|>20°$, including the polar caps. The differential extinction, $\Delta A_B=A_B(b)-A_B$ (90°), derived from the combined surface magnitudes and H I ratios (iii, iv) and colors (v) also follows closely the csc b law with a mean extinction coefficient $A_1=0.200\pm0.018$. These quantitative tests confirm the validity of the galactic extinction model adopted in RC2 and, in particular, the value of the polar extinction $A_1=0.20$. (68 refs.)

104937 Radio observations of compact H II regions. J.Krassner, J.L.Pipher, M.P.Savedoff (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA), B.T.Soifer.

Astron. J. (USA), vol.88, no.7, p.972-81 (July 1983).

Radio continuum observations at high (~10 arcsec) spatial resolution have been obtained for a number of compact H II regions using the NRAO Green Bank interferometer. Maps of the resolved sources are presented and the physical parameters of the H II regions derived. Each source detected is described in detail and the new radio information is compared with existing data. For some of the objects these are the first observations made with better than arcminute resolution. A significant fraction of the objects contain several hot spots, which are indicative of local density enhancements or the presence of several early-type stars. (39 refs.)

104938 Proper motions of Herbig-Haro objects. III. HH-7 through -11, HH-12, and HH-32. G.H.Herbig, B.F.Jones (Lick Obs., Univ. of California, Santa Cruz, CA, USA).

Astron. J. (USA), vol.88, no.7, p.1040-52 (July 1983).

For pt.II see ibid., vol.87, no.8, p.1223-32 (1982). Proper motions have been measured on Crossley and 120-in. plates for additional Herbig-Haro objects. The bright, nearly stellar HH-11 shows definite motion away from the heavily obscured H_2O maser and infrared source SSV-13, about 16″ distant. Three other nearby objects show no detectable motions. Repetitive ejection from the vicinity of SSV-13 at intervals of >500 years is suggested. Nuclei in the nearby extended object HH-12 show motion away from another obscured star, SSV-11, of type M1eα. The indicated travel time is 800-1400 years. All these objects have negative radial velocities with respect to the molecular cloud, and lie in regions of negative CO velocity. No objects have been found on the opposite sides of the exciting stars, where the velocity would presumably be positive. HH-32A, B are moving away from the bright T Tauri star AS-353A, and have both large positive velocities and double emission lines. The line splitting is interpreted in terms of pre- and post-shock gas on the front side of an (invisible) obstacle in the wind from AS-353A. (46 refs.)

104939 Cometary globules in the Gum-Vela complex. W.J.Zealey (Royal Obs., Edinburgh, Scotland), Z.Ninkov, E.Rice, M.Hartley, S.B.Tritton.

Astrophys. Lett. (GB), vol.23, no.3, p.119-31 (1983).

Twenty-nine cometary globules (CG) have been found in Gum-Vela, projected upon an annulus of angular radius 9.5°. The tails of the globules are directed away from a common central region. The velocity field based on 9 CGs can best be fitted by a slow expanding shell with a radius greater than 80 pc. The dominant velocity effects observed are due to galactic rotation. The phenomenon appears to be a later stage of that observed in the globules in the Rosette Nebula. It appears possible that the formation of the expanding shell is the result of the interaction of the stellar winds from ζ Puppis and γ^2 Velorum with the interstellar medium. The stretched globules formed due to either Rayleigh-Taylor instability in the shell or as the shell encountered dense interstellar cloudlets. (33 refs.)

104940 Equilibrium temperatures of interstellar iron grains. R.G.Tabak, A.K.Straitiff (Dept. of Phys. & Astron., Youngstown State Univ., Youngstown, OH, USA).

Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.199-206 (June 1983).

Temperature fluctuations are examined for iron grains and found to be minimal for sizes greater than 100 Å. Steady-state equilibrium temperatures are then calculated for a size distribution of iron particles ranging from 10^3 to 10^9 atoms per grain. The results are that iron grain temperatures are significantly greater than those of dielectric grains of comparable size in the same radiation field. (31 refs.)

104941 Structure of molecular clouds. VII. Energy balance in clouds with star formation (Type IIb). L.G.Stenholm (Inst. fur Theoretische Astrophys., Heidelberg, Germany).

Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.247-55 (Aug. 1983).

For pt. VI see ibid., vo.117, no.1, p.41-5 (1983). Studies the thermal equilibrium in molecular clouds with prominent star formation (Stenholm et al., 1981, Type IIb). The author derives an observationally based dust model as a supplement to the previously derived gas component model. The author discusses most of the heating and cooling processes, for dust and gas, suggested in the literature. Their efficiency is judged by their ability to explain the thermal structure of the observationally based dust-gas cloud model. (55 refs.)

104942 The bright stellar content of the giant galactic H II region NGC 3603. A.F.J.Moffat (Astron. Inst., Univ. Bonn, Bonn, Germany).

Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.273-8 (Aug. 1983).

NGC 3603 is the closest example of a massive giant H II region like those which serve as distance indicators in some extragalactic systems. In order to probe the stellar content of NGC 3603, optical spectra were obtained for nearly all member stars or unresolved clumps of stars brighter than $V=13.2$ ($M_v=-5.7$). Combined with BV photometry for the nine best single images, the spectral types yield mean differential extinction with no clear indication of real variability from star to star, and distance 7.0 ± 0.5 kpc. The total number of equivalent early O type stars of $M_v=-6.2\pm0.5$ is about twenty, easily accounting for the observed radio continuum emission. NGC 3603 contains proportionally fewer WR stars than NGC 2070 (O3-4) possibly due to the presence of relatively fewer very massive progenitor O stars. Alternately, this may be due to small number statistics. (21 refs.)

104943 Far ultraviolet observations of the expanding shell in Eridanus. F.Paresce, P.Jakobsen, S.Bowyer (Dept. of Astron., Univ. of California, Berkeley, CA, USA).

Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.300-8 (Aug. 1983).

A thin strip of the sky near the South Galactic Pole has been observed in the 1350-1750 Å wavelength band at high sensitivity and moderate spatial resolution by the EUV telescope on the Apollo-Soyuz mission. After correcting for hot stars in the instrument field of view, the measured count rates of this region were found to vary smoothly from a minimum of $\simeq55$ cs^{-1} near $l=30°$, $b=-60°$ to a maximum of $\simeq740$ cs^{-1} in the direction of $l=199°$, $b=-49°$ corresponding to specific intensities between $\simeq600$ and 8000 photons cm^{-2}s^{-1}sr^{-1} Å^{-1}, assuming a flat incident spectrum in this wavelength range. Three sources that, alone or together with reflection nebulae, might explain the high intensities in this region are H_2 fluorescence emission by cool clouds with a density $n_H=500$ cm^{-2}, H_1 two photon emission from ionized gas, and thermal emission from a fast radiative shock. The required emission parameters are compatible with the observed characteristics of the expanding shell in Eridanus which has been suggested to be connected with the stellar wind from the *I*OriOB association. (61 refs.)

104944 G296.05−0.50—a large-diameter supernova remnant. J.L.Caswell (Div. of Radiophys., CSIRO, Sydney, Australia), P.J.Barnes.

Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L55-8 (15 Aug. 1983).

A new map at 408 MHz made with the Molonglo Cross shows a supernova remnant (SNR) shell centered at $l=296.05°$, $b=-0.50°$ with a mean angular diameter of 33′. It is argued that a source of X-rays which had previously been interpreted as the emission from two SNRs is simply the emission from this single, large SNR, G296.05−0.50. Optical emission which lay outside the previously recognized portion of G296.05−0.50 is now seen to coincide with the newly mapped outlying regions of the radio shell. (15 refs.)

104945 Synthesis maps of ultraviolet observations of neutral interstellar gas. P.C.Frisch, D.G.York (Dept. of Astron., Univ. of Chicago, Chicago, IL, USA).

Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L59-63 (15 Aug. 1983).

The results of satellite observations of neutral interstellar material in front of 140 stars 10-3000 pc distant are shown projected onto representations of the galactic plane and of a plane passing through the galactic poles. The figures show that the contours of neutral hydrogen in the solar neighborhood asymmetrically surround the Sun, with the 5×18^{18} cm^{-2} contour at $\lesssim15$ pc in the Sco-Oph direction, but at $\gtrsim200$ pc in the third quadrant. This neutral gas distribution mirrors the distribution of the nearby B stars associated with the Gould belt. The maps clearly show the directions in which observations at $\lambda<912$ Å will be most successful. (31 refs.)

104946 Detection of $H^{15}NN^+$ and $HN^{15}N^+$ in interstellar clouds. R.A.Linke, M.Guelin, W.D.Langer (Crawford Hill Lab., Bell Labs., Holmdel, NJ, USA).

Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L85-8 (15 Aug. 1983).

$H^{15}NN^+$ and $HN^{15}N^+$ have been detected for the first time in an interstellar cloud, DR 21 (OH), through observations of their $J=1$-0 transitions near 90 GHz. These two isotopic species have nearly equal abundances. Comparison with the weakest component of $HN_2{}^+$ ($F=1$-0) yields an intensity ratio $^{14}N/^{15}N>170$, consistent with the terrestrial $^{14}N/^{15}N$ isotope ratio (270). The N_2H^+/HCO^+ abundance ratio has been found to be ~0.9. This value suggests that in DR 21 (OH) nitrogen could be mostly in the form of N_2 in the gas phase, while only 10% to 15% of carbon is in the form of gaseous CO. (20 refs.)

104947 The distribution of 6 centimeter H_2CO in Orion Molecular Cloud 1. K.J.Johnston (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA), P.Palmer, T.L.Wilson, J.H.Bieging.

Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L89-93 (15 Aug. 1983).

Measurements of 6 cm H_2CO emission associated with the Orion Molecular Cloud (OMC-1) show that the peak of the emission feature at 7.4 km s^{-1} is centered close to the infrared source IRc5, in the southern part of the KL nebula. The peak main-beam brightness is 9K, and the emission region has a deconvolved size of 25″×11″ (0.06×0.03 pc). Absorption by H_2CO is seen toward the southern peak found at 400 μm. The weaker absorption and emission features are consistent with sizes greater than 15″, showing clumpiness in the H_2CO emission and absorption. (21 refs.)

104948 Interstellar C_2 molecules in a Taurus dark cloud. L.M.Hobbs (Yerkes Obs., Univ. of Chicago, Williams Bay, WI, USA), J.H.Black, E.F.van Dishoeck.

Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L95-9 (15 Aug. 1983).

Five relatively strong interstellar absorption lines of the (2-0) Phillips band of C_2 near λ8760 are detected in the spectrum of HD 29647, a late B star which lies behind a substantial part of the Taurus molecular cloud complex about 20′ from TMC-1. In combination with newly determined oscillator strengths, the observations yield a column density $N(C_2)\approx9\times10^{13}$ cm^{-2}, which is comparable to those of widely distributed molecules like CH and H_2CO. Theoretical models of the observed C_2 rotational level populations indicate a kinetic temperature $T=14$K and a mean density $n\lesssim10^3$ cm^{-3}. HD 29647 is identified as a Hg-Mn peculiar star. (36 refs.)

104949 Observations of interstellar C_2 toward three heavily reddened stars. B.L.Lutz (Lowell Obs., Flagstaff, AZ, USA), R.M.Crutcher.

Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L101-5 (15 Aug. 1983).

Observations have been made of the 2-0 band of the Phillips system of interstellar C_2 toward the heavily obscured early-type stars VI Cygni No.12, HD 29647, and BD+66°1675. The first direct proof that the rotational excitation temperatures of interstellar C_2 are nonthermal was obtained. Toward VI Cygni No.12, the rotational distribution cannot be characterized by a single, unique excitation temperature; the distribution is consistent with radiative pumping models. A very strong linear correlation was found between $N(C_2)$ and E_{B-V}. (8 refs.)

104950 Polarization of interstellar molecular radiofrequency absorption lines. N.D.Kylafis (Inst. for Advanced Study, Princeton, NJ, USA), P.R.Shapiro.

Astrophys. J. Lett. Ed. (USA), vol.272, no.1, pt.2, p.L35-9 (1 Sept. 1983).

Predict that interstellar molecular radiofrequency absorption lines seen in the direction of radio continuum sources will, in general, be both linearly and circularly polarized, as a result of the linear dichroism and birefringence, respectively, of the interstellar medium. This linear dichroism and birefringence are caused by the non-local thermodynamic equilibrium population of magnetic sublevels. The amount of linear and circular polarization expected is discussed. (27 refs.)

104951 Search for Wolf-Rayet features in the spectra of giant H II regions. I. Observations in NGC 300, NGC 604, NGC 5457 and He 2-10. S.D'Odorico, M.Rosa, E.J.Wampler (European Southern Obs., Garching bei Munchen, Germany).

Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.1, p.97-108 (July 1983).

The results of a spectroscopic survey of continuum emission from giant H II regions in the galaxies NGC 300 and NGC 5457 (M101) are presented. In NGC 300, WR stars are detected in 2 out of 16 regions surveyed; in NGC 5457 in 2 out of 6. The evidence comes from the presence of broad emission bands in the blue (λλ4600-4700) and red (λλ5600-5900) spectral regions, identified with different lines of N V, N III, C IV and He II observed in galactic WR stars. New observations of the known WR emission bands in the giant H II region NGC 604 and in the galaxy He2-10 are also reported. (26 refs.)

104952 Absorption coefficients for CO molecules and molecular cooling of interstellar clouds. V.K.Khersonskii.
Bull. Spec. Astrophys. Obs.-North Caucasus (USA), vol.13, p.24-30 (1981). Translation of: *Astrofiz. Issled.-Izv. Spets. Astrofiz. Obs. (USSR)*, vol.13, p.30-9 (1981).
Detailed calculations are performed on the absorption coefficients for optically thin lines due to observed transitions in isotopic forms of the CO molecule. A wide range in kinetic temperature $T_k=10\text{-}100K$ is considered and also a wide concentration range $n=10\text{-}10^6$ cm^{-3}, the values being characteristic of interstellar gas clouds. The gas-cooling functions are calculated as arising from collisional excitation of rotational levels producing bulk energy losses and in the absence of gradients in the large-scale velocities. Analytical relationships are derived for the cooling functions in the limiting cases of small and large gas concentrations. (11 refs.)

104953 Determination of the parameters of the interstellar wind from observations of the L_α-background at large distances from the Sun. M.S.Burgin.
Cosmic Res. (USA), vol.20, no.5, p.515-19 (Sept.-Oct. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.5, p.725-9 (Sept.-Oct. 1982). [received: June 1983]
Multiple scattering of solar photons by interstellar hydrogen and the presence of a galactic background leads to a dependence of the intensity of L_α-radiation on distance from the Sun and on the direction of the line of sight which, far from the Sun, differs from the dependence predicted by an optically thin model. By carrying out measurements of the intensity of the L_α-background at fairly large distances from the Sun, one can estimate the hydrogen density in the interstellar wind and the intensity of the galactic background without relying on an absolute calibration of the equipment and without having accurate information about the flux in the solar L_α-line. (15 refs.)

104954 Near-infrared source counts in the galactic plane. II. A list of near-infrared sources. K.Kawara, T.Kozasa, S.Sato (Dept. of Phys., Kyoto Univ., Kyoto, Japan), H.Okuda, Y.Kobayashi, J.Jugaku.
Mem. Fac. Sci. Kyoto Univ. Ser. Phys. Astrophys. Geophys. Chem. (Japan), vol.36, no.2, p.353-84 (March 1983). In Japanese.
Results on near-infrared source counts are presented as a list of positions and magnitudes of sources observed in 17 selected areas sampled along the galactic plane between $l=349°$ and $l=45°$. The total scanned area was 12 square degrees, and 1989 sources brighter than 6.5 mag in the *K*-band are listed. They are also graphically presented in $(\alpha,\delta)-(l,b)$ maps classifying the magnitudes and the colors of the sources. (10 refs.)

98.50 THE GALAXY, EXTRAGALACTIC OBJECTS AND SYSTEMS

104955 The H I extent and deficiency of spiral galaxies in the Virgo cluster. R.Giovanelli (Arecibo Obs., Arecibo, Puerto Rico), M.P.Haynes.
Astron. J. (USA), vol.88, no.7, p.881-908 (July 1983).
Neutral hydrogen observations mapping along the optical major axis have been made with the Arecibo 305-m telescope and flat feed system for 24 spiral galaxies in the Virgo cluster. Comparison of observed flux integrals with those obtained from a numerical convolution of the antenna beam pattern and an assumed H I surface density distribution yields a measure of an effective H I size, taken to be that radius interior to which lies 70% of the total H I mass. The neutral hydrogen properties of the Virgo cluster spirals have been compared with those of a similar sample of isolated galaxies. The authors find that, for a given optical diameter, a Virgo core galaxy has a smaller H I extent than its optical counterpart; they measure the ratio of the H I to optical Holmberg diameter $d_{\mathrm{H\ I}}/d_{\mathrm{HO}}$ to be 0.70 for the 19 galaxies within a five degree projected radius of the cluster center, whereas those outside show $d_{\mathrm{H\ I}}/d_{\mathrm{HO}}\simeq 1.10$. Using the relation derived between the optical linear diameter and the H I mass, the authors are able to define a H I deficiency parameter and find that the galaxies in the Virgo core are, on the average, H I deficient by a factor of 2.7 with respect to the isolated galaxies. (60 refs.)

104956 Colliding and merging galaxies. II. S0 galaxies with polar rings. F.Schweizer, B.C.Whitmore, V.C.Rubin (Dept. of Terrestrial Magnetism, Carnegie Instn. of Washington, Washington, DC, USA).
Astron. J. (USA), vol.88, no.7, p.909-25 (July 1983).
For pt.I see Astrophys. J., vol.252, no.2, pt.1, p.455-60 (1982). The authors first present a detailed optical study of A0136−0801, a $16^1/_2$-mag 'spindle' galaxy girdled by a ring of gas, dust, and young stars. The spindle is a normal S0 disk seen nearly edge-on, as shown by its photometric profile and fast rotation ($\nu_{\mathrm{rot}}/\sigma_\nu=2.2$); a prolate structure seems to be ruled out. The surrounding ring runs over the poles of this S0 disk and serves as a probe of the vertical potential. The ring motions suggest that a massive halo extends far beyond the S0 disk (out to $3R_{25}$) and that this halo is more nearly spherical than flat. The authors then list 22 related galaxies and derive that a few percent of all field S0s possess near-polar rings or disks. They suggest that these structures are due to a second event, most likely the transfer of mass from a companion galaxy during a close encounter and occasionally also the merger of a companion. Although accretion occurs presumably at random angles, polar rings are favored statistically because of their slow differential precession and consequent longevity. Alternate evolutionary schemes are also discussed. Finally, the authors suggest that M82 may be forming a polar ring from former M81 material, and predict that the 'tilted bulge' of UGC 7576 is an S0 disk seen nearly edge-on. (69 refs.)

104957 The variability of the spectrum of Arakelian 120. B.M.Peterson (Dept. of Astron., Ohio State Univ., Columbus, OH, USA), C.B.Foltz, H.R.Miller, R.M.Wagner, D.M.Crenshaw, K.A.Meyers, P.L.Byard.
Astron. J. (USA), vol.88, no.7, p.926-33 (July 1983).
New spectroscopic and photometric observations of the variable Seyfert 1 galaxy Arakelian 120 are presented. These data are supplemented with published data from other sources. It is shown that Akn 120 exhibits both short-term and long-term variability, as do other Seyfert galaxies. The flux in the broad $H\beta$ emission line closely follows the optical continuum flux, which provides strong support for photoionization models and implies that the broad-line emitting region is very small (less than ~0.04 pc in extent). (27 refs.)

104958 The Local Group irregular galaxies LGS 3 and Pegasus. C.A.Christian (Canada-France-Hawaii Telescope Corp., Kamuela, HI, USA), R.B.Tully.
Astron. J. (USA), vol.88, no.7, p.934-8 (July 1983).
The Galileo/IFA 500×500 CCD camera was used to resolve red giant stars in the gas-rich dwarf galaxy LGS 3 at magnitudes fainter than $V=21.8$. Depending on whether these stars are $>10^9$ yr old or $10^8\text{-}10^9$ yr old, the distance of the galaxy is 0.7-1.2 Mpc. Although H I gas has been detected in this system, there has been no significant star formation for at least the last 7×10^7 yr. The CM diagram of LGS 3 is compared with the CM diagrams of the Pegasus irregular galaxy discussed by Hoessel and Mould. A distance of 1.3 Mpc is suggested for Pegasus, rather than the larger distance preferred by Hoessel and Mould or the very much larger distance offered by Sandage and Tammann. (15 refs.)

104959 The precision of velocity measurements from H I profiles. B.M.Lewis (Arecibo Obs., Arecibo, Puerto Rico).
Astron. J. (USA), vol.88, no.7, p.962-71 (July 1983).
The intrinsic precision of both systematic velocity and of the velocity width estimates derived from H I profiles of galaxies is modelled by a Monte Carlo simulation of the effects of noise. This permits the achieved precision to be estimated directly from the S/N ratio. In particular, a $S/N\gtrsim7$ is required for reliable velocity estimates. The results suggest that observers usually underestimate their precision. New observations of 21 galaxies were made from Arecibo, to compare velocity estimates derived from high S/N ratio profiles with the results of other observers. Surprisingly, these show that the 20% width (ΔV_{20}) of many narrow profiles are significantly overestimated. With these cases identified, the remaining data have a precision of 10 km s^{-1} that does not scale with ΔV_{20}. Furthermore, when $S/N\gtrsim10$ and the galaxies are smaller than the 3.3′ Arecibo beam, the precision of 21-cm estimates of the systematic velocity is 3.6 km s^{-1}. (16 refs.)

104960 Hydrodynamic and turbulent motions in the galactic disk. R.J.Quiroga (Dept. de Fisica, Univ. Federal de Minas Gerais, Belo Horizonte, Brazil).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.37-54 (June 1983).
Studies the hierarchy of motions and its relation to the galactic structure using available observational data in the 21-cm line. Absorption 21-cm data show two types of components in the cool clouds; a narrow one associated with dense clouds with molecular cores, and a wide one associated with low density features which can be considered as the largest eddies of a Kolmogorov spectrum or as the minimum features of the spiral structure. The author analyzes the relation between these components and the Kolmogorov law of turbulence, the relation with hydrodynamic motions and the tensorial form for these motions according to the Helmholtz theorem. Conditions for gravitational collapse of the clouds and the eventual influence of the magnetic field are discussed. (37 refs.)

104961 What is a spiral galaxy?. F.Hoyle.
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.55-68 (June 1983).
It is shown that hitherto mysterious properties of spiral galaxies can be understood if they have massive halos composed of unseen material, the elements of which are in motion radially in-and-out from the galactic center to an outer boundary with a radius of at least 100 kpc. A similar more compact model explains the curious properties of the system of NGC 7603, and if extended still further can provide a gravitational model for quasars. The most interesting possibility is that unseen halos consist of magnetic monopoles, each monopole having a mass of the order of the Planck mass, $(hc/2G)^{1/2}=1.54\times10^{-5}$ g, where h is Planck's constant divided by 2π. (5 refs.)

104962 Positron annihilation radiation from Seyfert nuclei and the cosmic diffuse γ-ray background. L.Bassani, A.J.Dean (Dept. of Phys., Univ. of Southampton, Southampton, England).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.135-40 (June 1983).
Observational features in the low energy γ-ray spectra of Seyfert galaxies are interpreted in terms of broad and blueshifted annihilation radiation. The possibility that this 'line' emission is the underlying source of the bump in the cosmic diffuse γ-ray background is investigated. The observational data available in the literature are then used to estimate the maximum temperature of the electron positron plasma and the average positron annihilation rate for Seyfert galaxies. The assumption that other active nuclei, namely radio galaxies and quasars, are powered by the same annihilation mechanism is used to set limits on their contribution to the cosmic diffuse γ-ray background. (23 refs.)

104963 A model for the emission spectrum of active galactic nuclei. T.J.-L.Courvoisier (ESA, Space Sci. Dept., EXOSAT Obs., ESOC, Darmstadt, Germany), M.Camenzind.
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.277-80 (June 1983).
The overall spectrum of active galactic nuclei is discussed in terms of a wind and shock model. The central object of the active galactic nuclei is the source of a strong supercritical wind. The interaction of the wind with the surrounding medium generates the nonthermal radiation observed in active galactic nuclei. The spectrum predicted by the wind and shock model is compared with the observations of the quasar 3C 273. (15 refs.)

104964 Elliptical galaxies: can rotation be effective in determining their shapes?. R.Caimmi (Istituto di Astronomia, Univ. di Padova, Padova, Italy).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.403-18 (June 1983).
Investigates the modelling of real galaxies—at least as a zeroth order approximation—in such a way that rotation can be effective in determinating their intrinsic shape. The connection between the presence of isotropy in the pressure and observed gradients of metal content in most galaxies are briefly discussed, next solid-body rotating EC polytropes are proposed as acceptable models and the limits of this approach are considered. Appropriate estimates of both the theoretical ratio of some characteristic projected rotational veloc-

ity to some characteristic projected peculiar delocity, V/σ, and the apparent ellipticity $\hat{e}^*$, are calculated, then the behaviour of V/σ vs $\hat{e}^*$ is compared with observations. Some implications of the results are also reported and discussed. The author shows that solid-body rotating EC polytropes may lead to a naive model of galactic evolution, which enables both to reconcile observed gradients of metal content with the trend exibited by V/σ vs $\hat{e}^*$, and to simulate the morphological sequence of real galaxies. (25 refs.)

104965 Shell structure in NGC 5128. D.F.Malin (Anglo-Australian Obs., La Serena, Chile), P.J.Quinn, J.A.Graham.
Astrophys. J. Lett. Ed. (USA), vol.272, no.1, pt.2, p.L5-7 (1 Sept. 1983).
Specially processed photographs are presented which show a system of shells within the extended elliptical component of the giant radio galaxy NGC 5128. The photographic techniques are outlined. The system of shells is interpreted as being the aftermath of a merger with a smaller disk galaxy about 10^9 yr ago. The authors discuss the possibility that this same event produced the broad dust lane and the associated stars and gas which presently form a rapidly rotating subsystem of the galaxy. (25 refs.)

104966 A survey of galaxy redshifts. IV. The data. J.Huchra, M.Davis (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA), D.Latham, J.Tonry.
Astrophys. J. Suppl. Ser. (USA), vol.52, no.2, p.89-119 (June 1983).
For pt.III see Ap. J., vol.254, no.2, pt.1, p.437-50 (1982). Presents the complete list of the best available radial velocities for the 2401 galaxies in the merged Zwicky-Nilson catalog brighter than 14.5 m_z and with b^{II} above +40° or below −30°. Almost 60% of the redshifts are from the CfA survey and are accurate to typically 35 km s^{-1}. (112 refs.)

104967 The new Milky Way. L.Blitz (Univ. of Maryland, College Park, MD, USA), M.Fich, S.Kulkarni.
Science (USA), vol.220, no.4603, p.1233-40 (17 June 1983).
Understanding of the large-scale structure of the Milky Way has undergone considerable revision during the past few years. The Galaxy is larger and much more massive than was previously supposed; the newly discovered mass consists of nonluminous matter which is likely to be the dominant form of matter in the Universe. New analyses of the atomic hydrogen gas show that the disk of the Galaxy is about twice as extended as was previously thought. Beyond the Sun, the gas is concentrated in large-scale, coherent spiral arms indicative of a regular four-armed spiral pattern. The outer edge of the disk has a remarkable scalloping. (59 refs.)

104968 The rotation of spiral galaxies. V.C.Rubin (Dept. of Terrestrial Magnetism, Carnegie Instn., Washington, DC, USA).
Science (USA), vol.220, no.4604, p.1339-44 (24 June 1983).
There is accumulating evidence that as much as 90 percent of the mass of the Universe is nonluminous and is clumped, halo-like, around individual galaxies. The gravitational force of this dark matter is presumed to be responsible for the high rotational velocities of stars and gas in the disks of spiral galaxies. At present, the form of the dark matter is unknown. Possible candidates span a range in mass of 10^{70}, from non-zero-mass neutrinos to massive black holes. (48 refs.)

104969 Are black holes necessary?. A.L.Peratt (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Sky & Telesc. (USA), vol.66, no.1, p.19-22 (July 1983).
The author discusses models of radio galaxies, with particular reference to observations of Cygnus A (3C 405). In the standard model the galaxy ejects beams of high-energy particles or relativistic plasma from a compact source in its nucleus. This compact object is usually identified as a black hole; however, an alternative model is possible in which energy is produced by the interaction of two plasma clouds which possess dipole magnetic fields. (3 refs.)

104970 The Lyapunov characteristic numbers and the number of isolating integrals in galactic models. P.Magnenat (Obs. de Geneve, Geneva, Switzerland).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.282-3
Observations show that the dynamical studies of galaxies must be undertaken in the frame of dynamical systems with 3 degrees of freedom. A first step consists of understanding the main properties of orbits in the simplest case of a 3-D conservative potential taking into account the most important nonlinear effects. Particularly the conditions of existence of 1 or 2 isolating integrals besides the Hamiltonian ('non-classical' integrals) are one of the main problems to be examined. (6 refs.)

104971 A search for microwave background diminution towards the cluster 0016+16. H.Andernach (Max-Planck-Inst. fur Radioastron., Bonn, Germany), D.Schallwich, G.B.Sholomitski, R.Wielebinski.
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.326-30 (Aug. 1983).
Observes the radio continuum emission in the direction of the distant cluster of galaxies C10016+16 at $\lambda\lambda$6.3 and 2.8 cm. Since at the shorter wavelength the temperature diminution of the microwave background towards this cluster does not exceed the decrement measured with the lower angular resolution, the authors conclude that the hot gas must be rather widely distributed. 104972 Ammonia toward DR 21: a weak maser in ortho-NH_3?. S.Guilloteau (Groupe D'Astrophys., Univ. Sci. et Medicale de Grenoble, Saint Martin D'Heres, France), T.L.Wilson, R.N.Martin, W.Batrla, T.A.Pauls.
Astron. & Astrophys. (Germany), vol.124, no.2, pt.1, p.322-5 (Aug. 1983).
Measurements of the $(J,K)=(1,1)$, (2,2), (3,3), and (4,4) rotation-inversion doublet lines of NH_3, made with the 100-m telescope toward the thermal continuum source DR 21 are presented. The results show absorption in the (1,1) and (2,2), neither absorption nor emission in the (4,4) lines of para-NH_3, and emission from the (3,3) line of ortho-NH_3. The authors interpret these results in terms of deviations from LTE in the population of the (3,3) doublet. Additional measurements of the (3,3) line with the VLA yield an upper limit of 30K to the line emission. From this the authors conclude that the deviations in the population of the (3,3) levels are small. (9 refs.)

104973 Determination of the properties of magnetic turbulence in radio sources. S.R.Spangler (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA).
Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L49-53 (15 Aug. 1983).
Considers the transport of polarized synchrotron radiation in a source possessing a highly irregular magnetic field, as proposed by Laing (1980, 1981). The transport equation has been solved in a special case, relating the observable correlation functions in the Stokes parameters Q and U to the correlation functions of magnetic field and plasma density in the source. A rough application of the results to observations of the radio galaxy 3C 166 indicates that the turbulent scale length may be a few percent of the lobe size. (7 refs.)

98.70J Quasars

104974 The statistics of quasar-galaxy separations. S.Phillips (Dept. of Appl. Maths. & Astron., Univ. Coll. Cardiff, Cardiff, Wales).
Astrophys. Lett. (GB), vol.23, no.3, p.155-9 (1983).
One of the arguments put forward in favour of physical associations between low redshift galaxies and high redshift quasars is shown to be void. (21 refs.)

104975 On the hypothesis of ejection of supermassive black holes from centers of galaxies and its application to quasar-galaxy associations. R.C.Kapoor (Indian Inst. of Astrophys., Bangalore, India).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.79-85 (June 1983).
It is argued that accreting supermassive black holes ejected from centers of galaxies are the likely models for the quasars observed in association with galaxies. Also pointed out are the implications of a suggestion by Horak (1982) to account for the excess redshifts of such quasars due to a combined effect of peculiar Doppler-motion and the gravitational field. (18 refs.)

104976 Common Lyman-alpha absorption lines in the triple QSO PG 1115+08. R.J.Weymann, C.B.Foltz (Steward Obs., Univ. of Arizona, Tucson, AZ, USA).
Astrophys. J. Lett. Ed. (USA), vol.272, no.1, pt.2, p.L1-4 (1 Sept. 1983).
Spectroscopic observations at a resolution of 1 Å have been obtained of the bright (A) and one of the faint (C) components of the triple QSO PG 1115+08 shortward to the Lyman-α emission line down to ~3200 Å. Two of the Lyman-α lines not associated with metal-containing absorption systems

are clearly present in the spectra of both objects. A lower limit of ~0.4 kpc for the lateral dimensions of one of these Lyα clouds follows if the lens system has a redshift of ~0.8. (12 refs.)

98.70Q X-ray and gamma-ray sources

104977 X-ray emission associated with gamma-ray bursts. J.Nishimura, M.Fujii, T.Yamagami (Inst. of Space & Astronautical Sci., Tokyo, Japan).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.87-96 (June 1983).
The energy spectra of gamma-ray bursts differ from those of black-body radiation and are similar to the thermal bremsstrahlung spectra of optically thin plasma. This could be realized if the source is located in the outer atmosphere of a neutron star. In this case, almost one half of the emitted photons hit the surface of the star. The surface of the star is heated to a temperature of the order 10^7K, and a dominant flux of X-rays with a black-body spectrum would be expected. The X-rays produced by this mechanism are detectable in the energy range from a few keV to 10 keV. This model is discussed in relation to observations in the X-ray region at the time of gamma-ray bursts, and modifications of this model are also presented. (12 refs.)

104978 Discovery of a redshift z=1.2 quasar with a flat radio spectrum in the field of the gamma-ray source CG 195+04. A.F.J.Moffat (Astron. Inst., Univ. Bonn, Bonn, Germany), R.Schlickeiser, M.M.Shara, W.Sieber, R.Tuffs, H.Kuhr.
Astrophys. J. Lett. Ed. (USA), vol.271, no.2, pt.2, p.L45-8 (15 Aug. 1983).
Several radio sources are located within the 90% confidence limit of the strong, unresolved γ-ray source CG 195+04. For the best radio candidate 0630+180, the authors have optically identified a quasar at $z=1.2$, the third such object found to lie within a *COS B* error circle. If the QSO 0630+180 really is associated with CG 195+04, it is the most luminous source of high-energy photons known. If its luminosity is due to proton enhancement, this may be the first step toward identifying a potential source of the nucleonic component of cosmic rays. (20 refs.)

104979 An identification for 'Geminga' (2CG 195+04) 1E 0630+178: a unique object in the error box of the high-energy gamma-ray source. G.F.Bignami, P.A.Caraveo (Istituto di Fisica Cosmica, CNR, Milano, Italy), R.C.Lamb.
Astrophys. J. Lett. Ed. (USA), vol.272, no.1, pt.2, p.L9-13 (1 Sept. 1983).
In the search for counterparts for *COS B* high-energy gamma-ray sources, 2CG 195+04 was covered with two Einstein Observatory IPC exposures and one follow-up HRI pointing. In a 10^4 s observation, four serendipitous sources have been found, three near to the detection limit and one, 1E 0630+178, at a flux level of approximately 2×10^{-12} ergs cm^{-2} s^{-1}. The 3″ HRI position has permitted an optical identification with a faint blue object, while VLA data at 6 cm do not show radio flux at the HRI position. The object appears to be unique on the basis of its observational characteristics, mainly the $L_x/L_v\approx1000$, the lack of a radio counterpart, and the absence of temporal variability and of spatial extent in the X-ray data. Moreover, the very small interstellar absorption suggests a distance of the object of approximately 100 pc (or less). Because of the peculiarity of the X-ray object the authors propose it for the counterpart of 2CG 195+04 'Germinga.'. (29 refs.)

104980 Transient X-ray source near 4U 1543−45. Y.Tanaka.
I.A.U. Circ. (USA), no.3854, 1 pp. (22 Aug. 1983).
Reports the discovery on 1983 August 18 of a bright transient X-ray source at $\alpha=15^h48^m\pm4^m$, $\delta=-47.5°\pm1.0°$. The location is consistent with that of 4U 15434−45. The X-ray source, which is increasing in intensity, was half as bright as Scorpius X-1 in the 0.5 to 3.7 keV band on August 21. (1 ref.)

104981 MXB 1730−335. G.Pollard, N.White, P.Barr, L.Stella.
I.A.U. Circ. (USA), no.3854, 1 pp. (22 Aug. 1983).
It is reported that the Rapid X-ray Burster (MXB 1730−335) is active. EXOSAT observations on 1983 August 7 and 15 show a persistent flux of about 50 mJy. Type 1 bursts occurred at an average interval of 80 minutes, but no type 2 bursts were observed. (1 ref.)

104982 The quadrupole component of the relic radiation in a quasi-hyperbolic cosmological model. H.V.Fagundes (Inst. de Fisica Teorica, Sao Paulo, Brazil).
Astrophys. Lett. (GB), vol.23, no.3, p.161-3 (1983).
A closed cosmological model is fitted to the quadrupole moment of the background radiation and to Hubble's constant. Then the author predicts an anisotropy in the latter, as well as the values of deceleration parameters, the density ratio, and (more speculatively) the total mass of the Universe. (6 refs.)

98.80 COSMOLOGY

(for observational cosmology, see 98.70V; for origin and evolution of galaxy, see 98.50)

104983 Neutron oscillation and the primordial magnetic field. C.Sivaram, V.Krishan (Indian Inst. of Astrophys., Bangalore, India).
Astrophys. Lett. (GB), vol.23, no.3, p.139-43 (1983).
The phenomenon of neutron-antineutron oscillations has been recently proposed as a novel consequence of grand unified theories. The sensitivity of the oscillations to the existence of a magnetic field and the presence of a large neutron population in the nucleosynthetic era of the big bang provides a lower limit on the strength of any ordered primordial magnetic field. This would supplement recent attempts to fix upper limits on the primordial field by considerations such as neutrino oscillations and helium production. (15 refs.)

104984 Limits on the accuracy of determining q_0 from supernovae. S.Phillipps (Dept. of Appl. Maths. & Astron., Univ. Coll. Cardiff, Cardiff, Wales).
Astrophys. Lett. (GB), vol.23, no.3, p.145-9 (1983).
The effects of peculiar velocities on the determination of q_0 from supernovae (and other methods) are discussed and the intrinsic errors evaluated. (16 refs.)

104985 Primordial quantum fluctuations and the origin of galaxies. H.R.Pagels (Rockefeller Univ., New York, NY, USA).
Astrophys. Lett. (GB), vol.23, no.3, p.151-4 (1983).
Using supersymmetry the author calculates the contribution of the one-loop autocorrelation function at temperature T_G, characteristic of the inflationary era, to the density contrast $\delta\rho/\rho$. The author obtains a Zeldovich spectrum and for perturbations of the size of the horizon finds $(\delta/\rho/\rho)_H\sim10^{-4}$ for $T_G\sim1.6\times10^{16}$ GeV. (8 refs.)

104986 On dissipational processes in the cosmological GUT era. M.Ostrowski (Astronomical Obs., Jagiellonian Univ., Krakow, Poland).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.127-34 (June 1983).
A discussion of equilibrium conditions in the cosmological GUT (≡Grand Unified Theories) era leads to the conclusion that viscous approximation is not adequate to describe kinetic dissipative processes acting at that epoch. The attempt of an alternative description is presented within the assumed simple model. The maximal possible gain of entropy is a slowly increasing function of the initial anisotropy parameter. The mechanism generating bulk viscosity in the gas of interacting massless particles is also presented. There is only a small dissipative effect connected with this phenomenon. (18 refs.)

104987 Primordial nucleosynthesis and scale-covariant cosmology. Yan-Feng Li (Dept. of Phys. & Astron., Univ. of Nebraska, Lincoln, NE, USA).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.255-9 (June 1983).
The scale-covariant theory of gravitation, which was proposed by Canuto et al. (1977), assumes that gravitational and atomic units are related by a scalar function of space-time. The cosmology based on this theory can explain very well the 3K radiation, as well as Hubble's redshift law. However, Falik (1979) derived a result from the scale-covariant cosmology which was in conflict with the observed helium abundance. Contrary to Falik, the author shows that if one chooses a gauge function $\beta\sim t^\alpha$ and α satisfies the condition $-{}^1/_3<\alpha<1$, the scale-covariant cosmology will be consistent with the observed cosmic-helium abundance. The value $\alpha={}^1/_2$ has recently been suggested by Canuto and Goldman (1982) on general grounds. (9 refs.)

104988 Spatially self-similar cosmological model of Bianchi type-$_1$I. D.Lorenz (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.419-22 (June 1983).
The Einstein equations are integrated for a tilted spatially self-similar Bianchi type-$_1$I space-time with 'stiff' matter content. The solution represents an anisotropic model which tends to isotropic expansion in a special case. (26 refs.)

104989 On the general vacuum solution with a cosmological constant for Bianchi type-VI$_0$. D.Lorenz (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.479-84 (July 1983).
Investigates the field equations for Bianchi type-VI$_0$ space-times with a non-vanishing cosmological constant. Exact solutions are given for the vacuum case of Bertotti-Robinson-type models. In addition a reduction of the field equations to a second order differential equation is given in the general case. The general vacuum case is discussed in various equivalent ways and a transcendental solution is derived. (12 refs.)

104990 The motion of test particles in black-hole backgrounds with non-zero cosmological constant. Z.Stuchlik (Dept. of Phys., Coll. of Mines, Ostrava-Poruba, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.129-49 (June 1983).
Due to the present indications of the existence of a non-zero cosmological constant, some aspects of the influence of $\Lambda\neq0$ on the character of test-particle motion in black-hole backgrounds are discussed. Equations of motion of electrically charged particles and magnetic monopoles are written in the most general Kerr-Newman-de Sitter dyon background. For the Kerr-de Sitter spacetime, the latitudinal motion is examined in detail by using the 'Chinese boxes' technique. The radial motion in the Schwarzschild-de Sitter background is considered with attention devoted to the existence and stability of circular orbits and to the properties of purely radial trajectories. Finally, the possibility of constructing an Einstein-Strauss-de Sitter model of the Universe is discussed. (12 refs.)

104991 The dependence of the surface and interior characteristics of theoretical stellar models, evolved with variable G, on the age of the isochrone. A.D.Pinotsis, P.G.Laskarides (Dept. of Astron., Univ. of Athens, Athens, Greece).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.149-54 (June 1983).
The evolution of the surface and interior characteristics of theoretical stellar models, evolved under the assumption of the Brans-Dicke cosmology is discussed for models with the same mass in three isochrones. As the age of the isochrone increases, the less massive models behave more and more like the more massive models of the isochrone with smaller age. The theoretical isochrones cannot be used as age indicators, at least not as freely as the ones received with constant G, since the position and shape of the isochrone for clusters of the same age and chemical composition depends also on the initial value of G as well as on the law of G variation. (9 refs.)

104992 Frame dragging in Einstein and Einstein zero mass scalar cosmologies. K.D.Krori, J.C.Sarmah, D.Goswami (Math. Phys. Forum, Cotton Coll., Gauhati, India).
Can. J. Phys. (Canada), vol.61, no.8, p.1198-204 (Aug. 1983).
Investigates the perturbations caused by a spherical rotating shell in a closed homogeneous and isotropic cosmological model in Einstein and Einstein zero mass scalar theories. It is found from the solutions that in both theories the

inertial frame at the origin is dragged with the angular velocity of the rotating shell during only a certain interval in the evolution of the Universe when the shell covers the whole Universe. (8 refs.)

104993 The universe from $<10^{-36}$ second to $>10^{30}$ years. I. M.J.Rees (Inst. of Astron., Univ. of Cambridge, Cambridge, England).
Curr. Sci. (India), vol.52, no.10, p.443-9 (20 May 1983).
Progress in astronomy over the last twenty years has been apparent to any reader of the scientific press, or even the newspapers. Galaxies, quasars, black holes and the big bang have entered the general vocabulary, if not the common understanding. The author discusses galaxies and their constituent stars: how they form and evolve to their eventual fate. He asks a similar question about the entire Universe: its beginnings, and its fate in the very long term. In particular, will it go on expanding for ever, or will it recollapse in a universal cataclysm after a finite time? Research programmes now in progress may give a reliable long term forecast within this decade. (4 refs.)

104994 Geometry of multidimensional universes. R.Coquereaux, A.Jadczyk (CERN, Geneva, Switzerland).
Commun. Math. Phys. (Germany), vol.90, no.1, p.79-100 (1983).
Let G be a compact group of transformation (global symmetry group) of a manifold E (multidimensional universe) with all orbits of the same type (one stratum). The authors study G invariant metrics on E and show that there is one-to-one correspondence between those metrics and triples $(g_{\mu\nu}, A_\mu^{a}, h_{\alpha\beta})$, where $g_{\mu\nu}$ is a (pseudo-) Riemannian metric on the space of orbits (space-time), $A_\mu^{\hat{a}}$ is a Yang-Mills field for the gauge group $N|H$, where N is the normalizer of the isotropy group H in G, and $h_{\alpha\beta}$ are certain scalar fields characterizing geometry of the orbits (internal spaces). The scalar curvature of E is expressed in terms of the component fields on M. Examples and model building recipes are also given. The results generalize those of non-Abelian Kaluza-Klein theories to the case where internal spaces are not necessarily group manifolds. (41 refs.)

104995 The stability of general relativistic cosmological theory. J.D.Barrow (Astron. Centre, Sussex Univ., Brighton, England), A.C.Ottewill.
J. Phys. A (GB), vol.16, no.12, p.2757-76 (21 Aug. 1983).
The authors analyse the behaviour of homogeneous and isotropic solutions to a gravity theory that arises from the variation of an arbitrary analytic function of the space-time scalar curvature. Such a theory generalises Einstein's general relativity wherein this function is linear in the curvature. They prove conditions for the existence and stability of the general relativistic de Sitter and Friedmann solutions within the general theory, prove necessary and sufficient conditions for the existence of cosmological singularities and particle horizons and analyse the asymptotic behaviour of ever-expanding Universe models. The conditions under which Minkowski space-time and Schwarzschild space-time are stable is investigated and their instability, together with the pathological behaviour of certain cosmological models, traced back to the non-minimality of the stationary action giving rise to the field equations. The significance of these results for quantum theories of gravity and the 'inflationary' model of the early Universe is discussed. (49 refs.)

104996 Vacuum field, modified cosmical term and non-singular cosmology. V.B.Johri (Dept. of Math., Indian Inst. of Technol., Madras, India), R.Chandra.
J. Math. & Phys. Sci. (India), vol.17, no.1, p.73-86 (Feb. 1983). [received: Aug. 1983]
The significance of the cosmological principle in proposing a modified form of the cosmical term representing the vacuum field in the Einstein field equations has been discussed, particularly with regard to the initial stages of the evolution of the Universe. A non-singular cosmological model expanding out from the hadron era has been constructed with the help of the modified cosmical term. (26 refs.)

104997 Newtonian cosmology (problems of didactics of cosmology). E.Skarzynski (Inst. Filozofii, Uniwersytetu Jagiellonskiego, Krakow, Poland).
Postepy Astron. (Poland), vol.31, no.1, p.45-52 (Jan.-March 1983). In Polish.
Presents different methods of model construction in Newtonian cosmology. Newtonian cosmology is very convenient for discussion of local problems, so the problems presented are of great didactic importance. The constant k receives a new interpretation in relativistic cosmology as the curvature of space. (11 refs.)

104998 Mechanism of generating isothermal perturbation by a strong *CP* nonconservation. M.Yoshimura (Nat. Lab. for High Energy Phys., Ibaraki, Japan).
Phys. Rev. Lett. (USA), vol.51, no.6, p.439-42 (8 Aug. 1983).
A large-scale inhomogeneity of the coherent axion field may exist in the early Universe. This gives a spatially varying source of strong *CP* nonconservation and, when coupled to baryon-nonconserving interaction, may lead to generation of the isothermal perturbation of baryon density. A specific mechanism is presented, in which a three-body decay of a heavy Majorana lepton gives the additional baryon generation. (17 refs.)

104999 Compactification of Friedmann's hyperbolic model. H.V.Fagundes (Inst. de Fisica Teorica, Sao Paulo, Brazil).
Phys. Rev. Lett. (USA), vol.51, no.6, p.517-18 (8 Aug. 1983).
A compact hyperbolic three-manifold is substituted for the infinite space H^3, as space section of Friedmann's cosmological model of negative curvature. Some consequences are briefly analyzed. In particular it is shown that an apparent observational isotropy persists when the particle horizon intersects an anisotropic region of space. (8 refs.)

105000 Irregularities formed by a cosmological axion field. M.Fukugita, M.Yoshimura (Nat. Lab. for High Energy Phys., Ibaraki, Japan).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.181-4 (28 July 1983).
A cosmological axion field which was not dissipated fast enough from the early universe may lead to a gross inhomogeneity well before the present epoch. This gives a possibility of triggering galaxy formation. Further collapse is not inhibited and can produce black holes on various mass scales. (15 refs.)

105001 New constraints on neutrino masses from cosmology. L.M.Krauss (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.37-43 (18 Aug. 1983).
The author raises the lower bounds on both heavy unstable and stable neutrino masses, exploiting both the phenomena of neutrino mass mixing and possible Majorana mass terms. Stable heavy neutrinos with Majorana masses (the generic case) have an annihilation rate which is p-wave suppressed. Thus in order to have sufficient cosmic annihilation it is found that the previous lower bound of $m \geq 2$ GeV must be raised to $m_\nu \gtrsim 5$ GeV assuming estimates of the present mass density remain unchanged. Unstable neutrinos are constrained by incorporating both new data on mass mixing from experiment and the annihilation suppression described above with standard nucleosynthesis cosmology. In this case the author finds $m \geq 23$ MeV, increasing the former bound by more than an order of magnitude. (11 refs.)

105002 The anthropic principle. P.C.W.Davies (School of Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Prog. Part. & Nucl. Phys. (GB), vol.10, p.1-38 (1983).
Starts by discussing numerical accidents in nuclear structure, stars, galaxies and particle masses and then moves on to describe cosmological dynamics, cosmic repulsion and the entropy of the Universe. The author then presents some ideas on the anthropic principle, the change from weak to strong theories and the many universes theory. (59 refs.)

105003 Energy, stability and cosmological constant. S.Deser (Dept. of Phys, Brandeis Univ., Waltham, MA, USA).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.377-89
The definition of energy and its use in studying stability in general relativity are extended to the case when there is a nonvanishing cosmological constant Λ. Existence of energy is first demonstrated for any model (with arbitrary Λ). It is defined with respect to sets of solutions tending asymptotically to any background space possessing timelike Killing symmetry, and is both conserved and of flux integral form. When $\Lambda<0$, the energy is shown to be positive, and hence stability established, for all systems tending to anti-De Sitter space. Supergravity methods are used here, upon defining spinorial charges as flux integrals which obey the global graded algebra. For $\Lambda>0$, small excitations about De Sitter space are stable inside the event horizon. Outside excitations can contribute negatively due to the Killing vector's flip at the horizon. This is a universal phenomenon associated with the possibility of Hawking radiation. Apart from this effect, the $\Lambda>0$ theory appears to be stable, also at the semi-classical level. (18 refs.)

105004 Phase transitions in the early Universe. T.W.B.Kibble (Blackett Lab., Imperial Coll., London, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.391-408
Grand unification and the hot big-bang theories both have phase transitions in the early history of the Universe, where the symmetry was reduced. The author discusses various topological structures generated at these transitions such as domain walls, strings and monopoles. (35 refs.)

105005 Complete cosmological theories. L.P.Grishchuk (Shternberg Astron. Inst., Moscow, USSR), Ya.B.Zeldovich.
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.409-22
The authors attempt to give a rational explanation for the origin of the initial conditions which lead to the so-called standard cosmological model. They discuss 'complete models' which describe the universe from the very beginning (including the quantum gravitational stage), up to the present time. (33 refs.)

105006 The cosmological constant and the weak anthropic principle. S.W.Hawking (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.423-32
One way of explaining why the observed cosmological constant is so small would be to appeal to the weak Anthropic Principle, that the theory which describes the Universe must be such as to allow the development of intelligent life: if it did not, there would not be anyone to observe the theory. In the case of the cosmological constant one could argue that a value slightly more negative than the observed limit would have caused the Universe to recollapse before life could have developed while a more positive value would have caused the Universe to expand too rapidly to allow the formation of galaxies. (no refs.)

BIBLIOGRAPHY INDEX

Ab initio gradient revolution in structural chemistry, (64 refs.) 100247
Absolute configuration determination using NMR techniques, (130 refs.) 100425
Acoustic patterns of apraxia of speech, (53 refs.) 103899
Adsorption from multicomponent solutions of nonelectrolytes on solids, (144 refs.) 102150
AFGL atmospheric absorption line parameters compilation, 1982 edition, (80 refs.) 104558
Al-Zn-Mg alloys, decomposition processes, (186 refs.) 103157
Amorphous semiconductors electronic structure, (565 refs.) 102241
Analysis of Ar3p^6 and Kr4p^6 photoionization from photoelectron-spin-polarization data, (88 refs.) 100334
Anthropic principle for cosmology, (59 refs.) 105002
Australian gas supply until year 2000, some policy options, (56 refs.) ... 103640
Beta-alumina for sodium-sulphur batteries, (42 refs.) 103674
Beta strength function shape, consequences for nuclear physics and astrophysics, (462 refs.) 99548
Celestial object nomenclature, (900 refs.) 98663
Chandler wobble, (64 refs.) 104169
China Mesozoic tectonics, (142 refs.) 104315
Commercial image analysers and microscopical images characterisation, (50 refs.) 99177
Complex perovskite-type oxides, crystal structure and physical properties, (84 refs.) 101675
Compositional and doping superlattices in III-V semiconductors, (99 refs.) 102496
Concentration process in the formation of development centres in silver halide microcrystals, (79 refs.) 103555
Conducting polymer soliton models, (73 refs.) 102360
Cosmic ray nuclei, (87 refs.) 104697
Covalent semiconductors, charge transport, Monte Carlo methods, (177 refs.). 102371
Cretaceous climate, (110 refs.) 104553
Critical dynamics near the λ transition in ^{3}He-^{4}He mixtures, (105 refs.) 102107
Crustal movement, (51 refs.) 104329
Crystal structure and density of Ti halides and chalcogenides;, (370 refs.) 98667
Crystal structure and density of Ti intermetallic compounds, (769 refs.) 98666
DC breakdown of ultra-high vacuum gaps, (68 refs.) 101487
Defect structure analysis with ENDOR, (57 refs.) 102778
Determination of tinnitus loudness considering the effects of recruitment, (55 refs.) 103879
Developmental changes in the human visual system as reflected by the latency of the pattern reversal VEP, (58 refs.) 103848
Diffusion and the physics of chemoreception, (73 refs.) 103825
Diffusion in Ti and its alloys, (81 refs.) 98668
Diffusion of small molecules in polymers, (193 refs.) 102059
Disclinations in solids, (200 refs.) 101705
Earth core—magnetism, (109 refs.) 104215
Earth tides, (51 refs.) 104172
East Pacific Rise, (74 refs.) 104334
Elastic and rotational excitation of the oxygen molecule by intermediate-energy electrons, (56 refs.) 100579
Energy transport dynamics in ternary molecular solids, (62 refs.) 102922
Fast diffusion along defects and corrugations in phospholipid $P_{\beta'}$ liquid crystals, (59 refs.) 103778
Fibre optic detectors, (122 refs.) 100921
Fibrillation of the mixtures of crystallizable, amorphous and poorly crystalline polymers, (78 refs.) 101829
Fjords—physical oceanography, (157 refs.) 104387
Flow acoustics problems, (234 refs.) 101209
Fluorescent material colorimetry, (47 refs.) 99155
Galactic extinction of extragalactic objects, (68 refs.) 104936
Galaxy redshifts, (112 refs.) 104966
Geodetic control surveys, (89 refs.) 104170
Geodetic techniques, (129 refs.) 104624
Geodetic theory, (73 refs.) 104173
Geoelectromagnetic induction, (350 refs.) 104218
Geomagnetic anomalies, (230 refs.) 104216
Geomagnetic reversals and excursions, (59 refs.) 104213
Geomagnetic variations, (160 refs.) 104212
Geopotential field studies, (73 refs.) 104174
High level radioactive waste characterisation and storage, (58 refs.) 99616
High resolution electron microscopy, (57 refs.) 101509
Hungary geothermal conditions, (148 refs.) 104284
Hyperthermia, immunity and metastasis, (62 refs.) 103793
Interaction potentials for Li$^+$-rare-gas systems, (53 refs.) 100505
Intramolecular energy redistribution in polyatomic ions, (115 refs.) 100292
Laser chemical etching of conducting and semiconducting materials, (53 refs.) 103366
Lattice dynamics of polyacetylene, (71 refs.) 101887
Lattice dynamics of polyacetylene, (55 refs.) 101888
Lattice gauge theories, Monte Carlo computations, (120 refs.) 99308
Lead in Central Pacific Ocean, (52 refs.) 104397
Line radiation from hot plasma, (91 refs.) 104725
Localised defect radiative and nonradiative deexcitation, (59 refs.) 101688
LWR safety research at EPRI, (90 refs.) 99698
Magnetic polarity stratigraphy, (132 refs.) 104214
Magnetic superconductors, (59 refs.) 102560
Mars—satellite origin, (92 refs.) 104764
Maximum entropy principle, (141 refs.) 98933
Measurement techniques for Ra and actinides in man, (81 refs.) 104063
Mid-Atlantic Ridge, (148 refs.) 104330
Milky Way structure, (59 refs.) 104967
Model potential in short hydrogen bonds, (54 refs.) 100500
Molecular clouds, (55 refs.) 104941
Molecular complexes of the hydrogen halides studied by matrix isolation infrared spectroscopy, (166 refs.) 100390
Molecular rotation in liquids, (60 refs.) 100396
Molecular structure and reaction mechanism: a topological approach to quantum chemistry, (136 refs.) 103490
Ne-Ne potential-energy curve and related properties, (71 refs.) 100506
Niobium single crystals temperature and strain rate dependence in cyclic deformatiom, (50 refs.) 103207
Non-ideal plasmas of metal vapours, (158 refs.) 101443
Non-relativistic approach to elastic ed scattering, (54 refs.) 99565
Nonlinear transformations and integrable evolution equations, (96 refs.) 98726
Nuclear β-decays in stellar interiors, (54 refs.) 104852
Nuclear band structure, direct calculus of observables, (134 refs.) 99492
Nuclear data sheets for A=108, (151 refs.) 98669
Nuclear magnetic double resonance: the use of difference spectroscopy, (203 refs.) 99142
Organic conductors and related phenomena, (238 refs.) 98681
Palaeomagnetism, (234 refs.) 104217
Perturbation method in boundary-value problems of the mechanics of deformable bodies, (187 refs.) 98762
Phase conjugation in stimulated scattering, (123 refs.) 100862
Phase diagrams of binary metal alloys, (58 refs.) 101912
Phase diagrams of Ti alloys, (344 refs.) 98665
Philippine Islands tectonics, (95 refs.) 104318
Photometry of dwarf novae, (97 refs.) 104872
Planetary geodesy, (182 refs.) 104756
Plastic deformation of BCC metal and alloys, (110 refs.) 103227
Point-contact electron-phonon interaction spectra of pure metals, (85 refs.) 101885
Polar motion and Earth rotation, (121 refs.) 104176
Polymer dynamics, kinetic Ising model, (55 refs.) 102812
Positrons and solid state physics, (56 refs.) 102989
Potassium currents in the frog node of Ranvier, (95 refs.) 103839
Proton momentum distributions in ^{12}C and ^{16}O(e,e′p), (51 refs.) 99567
Prototropic charge migration in water, (62 refs.) 103515
PWR plants primary/secondary circuits corrosion, (70 refs.) 99691
QCD, lattice gauge approach, (120 refs.) 99310
Quantum chromodynamics: theory and experiment, (73 refs.) 99415
Quarks and leptons, possible substructure, (288 refs.) 99436
Radiation belts ionic composition, (133 refs.) 104680
Radiation damage correlation in fusion reactor materials, (56 refs.) 101805
Radio interferometry, (81 refs.) 104175
Ranges, reflection and secondary electron emission, (78 refs.) 101824
Rapid solidification: use of metastable phase diagrams, (52 refs.) 103137
Renormalisation group and critical phenomena, (267 refs.) 99309
RFQ accelerating structures for linacs, (54 refs.) 100088
S0 galaxies with polar rings, (69 refs.) 104956
Satellite altimetry, (136 refs.) 104177
Satellite positioning, (88 refs.) 104178
Sb cpds., Mossbauer parameter calcs, (68 refs.) 100433
Scattering from sinusoidal gratings, Kirchhoff approx. evaluation, (62 refs.) 100656
Scotland crust evolution, (63 refs.) 104317
Sensitiser centre formation, properties, function and efficiency, (70 refs.) 99210
Shear modification of polymers, (79 refs.) 101163
Short and long range schematic interactions, effects on nuclear properties, (89 refs.) 99557
Spiral galaxies in Virgo cluster, (60 refs.) 104955
Spreading of liquids on solid surfaces, (77 refs.) 102119
SQUID biomagnetic measurements, (61 refs.) 104010
Statistical mechanics of cellular automata, (184 refs.) 98935
Stellar magnetic field measurements, (230 refs.) 104746
Strange attractors, (221 refs.) 98973
Strongly relaxed defects in crystalline and amorphous oxides, (73 refs.) 101693
Structural domains in proteins and their role in the dynamics of protein function, (326 refs.) 103783
Structural glasses, (53 refs.) 101565
Suggested limit for population exposure to radiofrequency radiation, (138 refs.) 104058
Sun, magnetic flux tubes, (103 refs.) 104828
Surface core level shifts in metals, (61 refs.) 102476
Sweden earthquake data analysis, (149 refs.) 104219
Techniques for the measurement of forces between solids, (183 refs.) 99095

TEM/STEM requirements: multipurpose or specialized instruments?, (50 refs.)....99238

Thermochemical properties of Ti; its compounds and alloys, (219 refs.).. 98664

Thin films and froth flotation, (114 refs.)....102125

Transport properties of ground state nitrogen atoms, (51 refs.).... 100494

Turbulence modeling for computational aerodynamics, (110 refs.).... 101192

Ultrasoft X-ray emission from atoms and molecules, (69 refs.)....100300

Ultrasound transducers for pulse-echo medical imaging, (122 refs.).... 103995

Unification and grand unification, (75 refs.)....99393

Upper critical fields and superconducting transition temperatures of some zirconium-base amorphous transition-metal alloys, (136 refs.)....102557

Van der Waals molecules, Rydberg states, (77 refs.)....100493

Variational principles, unified construction formulation;, (213 refs.)....98735

Vibrational energy localisation, (95 refs.).... 100360

Vibrational spectra of gas-phase dimers, (61 refs.)....100394

Wave deformation in the surf zone, (66 refs.).... 104379

X-irradiated Ehrlich ascites tumour cells, (52 refs.)....103987

BOOK INDEX

AC loss and macroscopic theory of superconductors; W.J.Carr Jr., [New York, USA: Gordon & Breach 1983] 98671

Charged beam interaction with solids; Y.-H.Ohtsuki, [London, England: Taylor & Francis 1983] 98675

Introduction to optical fibers; A.H.Cherin, [New York, USA: McGraw-Hill 1983] 98680

Low light level detectors in astronomy; M.J.Eccles, M.E.Sim, K.P.Tritton, [Cambridge, England: Cambridge 1983] 104739

Medical imaging systems; A.Macovski, [Englewood Cliffs, NJ, USA: Prentice-Hall 1983] 98677

Origin and evolution of planetary atmospheres; A.Henderson-Sellers, [Bristol, England: Adam Hilger 1983] 98662

Quantum processes in polar semiconductors and insulators; H.Stumpf, [Braunschweig, Germany: Vieweg 1983] 98679

Quantum theory of light. Second edition; R.Loudon, [Oxford, England: Clarendon Press 1983] 98678

Quantum theory of magnetism. Second corrected and updated edition; R.M.White, [Berlin, Germany: Springer-Verlag 1983] 98676

Size effects in thin films; C.R.Tellier, A.J.Tosser, [Amsterdam, Netherlands: Elsevier 1982] 98674

Spectroscopy and excitation dynamics of condensed molecular systems; *V.M.Agranovich, R.M.Hochstrasser (editor/s),* [Amsterdam, Netherlands: North-Holland 1983] 98672

Traceable temperatures. An introductory guide to temperature measurement and calibration; J.V.Nicholas, D.R.White, [Wellington, New Zealand: Science Information Division, DSIR 1982] 98670

Vacuum technology, thin films, and sputtering. An introduction; R.V.Stuart, [London, England: Academic Press 1983] 98673

CONFERENCE INDEX

Accelerator engineering and technology; Santa Fe, NM, USA, 21-23 March 1983, [Aug. 1983] 99116, 99120, 99741−3, 99747−69, 99810−64, 99924−000000, 100202−7, 100219, 100651

Accelerator engineering and technology; Santa Fe, NM, USA, 21-23 March 1983, [Aug. 1983] 99110, 99138−9, 99688, 99716−17, 99744, 99770−807, 99865−917, 100057−165, 100173−5, 100220, 100716, 100781−4, 100790, 101826, 102601, 102701, 104031, 104052, 104114

Advances in geophysics; Dallas, TX, USA, 5-6 Oct. 1981, [10 April 1983] 98630 (introductory abstract), 104197, 104249−53, 104288, 104321

Alloy phase diagrams; Boston, MA, USA, Nov. 1982, *L.H.Bennett, T.B.Massalski, B.C.Giessen (editor/s),* [New York, USA: North-Holland 1983] 98652 (introductory abstract), 101587−9, 101624−6, 101904, 101912−16, 101963, 101988, 102012−17, 102143, 102558, 103108, 103115−23, 103137−9

Analysis and interpretation of atmospheric CO_2 data; Bern, Switzerland, 14-18 Sept. 1981, [20 April 1983] 98631 (introductory abstract), 103756, 104398, 104469−72

Applications of holography; San Diego, CA, USA, 24-25 Aug. 1982, [1983] 98623 (introductory abstract), 99166−8, 99704, 100680−95, 100978

Applied geophysics; Copenhagen, Denmark, 10-12 Jan. 1983, [1983] 98626 (introductory abstract),

Astrophysical jets; Torino, Italy, 7-9 Oct. 1982, *(Osservatorio Astron. Padova; Soc. Astron. Italiana; et al) A.Ferrari, A.G.Pacholczyk (editor/s),* [Dordrecht, Netherlands: Reidel 1983] 98661 (introductory abstract),

CERN School of Physics; Cambridge, England, 5-18 June 1982, [Geneva, Switzerland: CERN 1983] 98658 (introductory abstract), 99336−8, 99393, 99417, 99424, 99486, 104734

Chemistry of materials at high temperatures; Harwell, Oxon., England, 7-10 Sept. 1981, [1982] 101979, 102039, 102060, 102080, 102158, 103111, 103125, 103502, 103570

Circuits and systems; Toledo, OH, USA, 4-5 Aug. 1980, *A.R.Thorbjornsen, G.W.Zobrist (editor/s),* [North Hollywood, CA, USA: Western Periodicals 1980] 102463−4, 103530, 104552

Circuits and systems, 1981; Albuquerque, NM, USA, 29-30 June 1981, *S.Karni (editor/s),* [North Hollywood, CA, USA: Western Periodicals 1981] 99729, 100715, 100808, 100873, 103494, 103662

Circuits and systems, 1983; Newport Beach, CA, USA, 2-4 May 1983, [New York, USA: IEEE 1983] 100679, 104274, 104632

Cloud physics meteorological problems; Konigstein, Germany, 17-19 May 1982, [June 1983] 98638 (introductory abstract),

Cohesive properties of semiconductors under laser irradiation; Cargese, Corsica, France, 19-30 July 1982, *L.D.Laude (editor/s),* [The Hague, Netherlands: Martinus Nijhoff 1983] 98653 (introductory abstract),

Computers in cardiology; Seattle, WA, USA, 12-15 Oct. 1982, *(IEEE)* [Silver Spring, MD, USA: IEEE Computer Society Press 1983] 103841−2, 103935, 104002−9, 104045−51, 104096−101, 104107−9, 104116, 104155−6

Condensed Matter Division of the EPS general conference; Lausanne, Switzerland, 28-30 March 1983, *(Swiss Nat. Sci. Found.; Swiss Soc. Natural Sci.; Federal Inst. Technol)* [1983] 98627 (introductory abstract), 98741, 98802, 98951−3, 99003−4, 99058, 99194, 99237, 100472, 100775, 100810, 101215, 101509, 101511, 101537, 101556, 101563−5, 101591, 101603−4, 101633, 101876, 101895−6, 101918−19, 101943, 101978, 102116, 102129, 102156−7, 102183, 102231, 102242, 102257−8, 102264, 102270, 102277, 102294, 102303−4, 102317, 102333, 102338, 102357, 102360, 102429, 102444, 102476−7, 102494, 102498, 102550, 102560−1, 102570, 102574, 102576, 102614, 102623, 102664, 102746, 102794, 102989, 103029, 103593, 103791

Cosmic magnetic fields; Florence, Italy, 21-23 Oct. 1982, [1982] 98636 (introductory abstract),

Cosmochemistry and origin of life; Maratea, Italy, 1-12 June 1981, *C.Ponnamperuma (editor/s),* [Dordrecht, Netherlands: Reidel 1983] 98647 (introductory abstract),

Cosmology and relativistic astrophysics; Konstanz, Germany, 21-25 March 1983, [1983] 98639 (introductory abstract),

Distributed parameter systems; Toulouse, France, 29 June-2 July 1982, *(IFAC) J.-P.Babary, L.Le Letty (editor/s),* [Oxford, England: Pergamon 1983] 101325, 103660, 103804

Dynamical systems and chaos; Sitges, Barcelona, Spain, 5-11 Sept. 1982, *L.Garrido (editor/s),* [Berlin, Germany: Springer-Verlag 1983] 98650 (introductory abstract), 98729−30, 98756−7, 98774−5, 98857, 98973−99, 99054, 99068, 101256, 101356, 102426, 102587, 104718, 104970

Earthquakes and volcanism; Tokyo, Japan, 12-13 May 1982, [1983] 98643 (introductory abstract),

Electro '81; New York, USA, 7-9 April 1981, [El Segundo, CA, USA: Electron. Conventions 1981] 104629−31

Energy for the eighties; Los Angeles, CA, USA, 28 Oct. 1980, *(Los Angeles Council Eng. Sci)* [North Hollywood, CA, USA: Western Periodicals Company 1980] 98649 (introductory abstract), 99687, 99713, 103644−6, 103663−4, 103708

Energy policy for Australia; Canberra, Australia, 11-13 May 1983, *(Australian Inst. Energy; Instn. Eng., Australia)* [Barton, Australia: Instn. Eng., Australia 1983] 98613 (introductory abstract), 99715, 103631−2, 103637−43, 103661, 103665

Environmental effects on fibre-reinforced plastics; London, England, 12-13 July 1983, *(Carr Reinforcements; Ciba-Geigy Plastics Div.;Fothergill Rotorway Composites; Hysol Grafil; Pilkington/Fibreglass)* [July 1983] 98620 (introductory abstract), 102019, 102058, 103179, 103191, 103213, 103265−70, 103341−5

European rocket & balloon programmes & related research; Interlaken, Switzerland, 11-15 April 1983, [Paris, France: ESA 1983] 98654 (introductory abstract),

Fabrication science 3; London, England, 13-14 Dec. 1982, [May 1983] 98640 (introductory abstract), 103042, 103093−7, 103237

Field measurement and calibration using electro-optical equipment: Issues and requirements; San Diego, CA, USA, 24-25 Aug. 1982, [1983] 98622 (introductory abstract), 99181, 100788, 101361, 103774, 104361, 104560−2, 104586−8

Fifteenth Hawaii International Conference on System Sciences 1982; Honolulu, HI, USA, 6-8 Jan. 1982, *(Univ. Hawaii; Univ. Southwestern Louisiana) W.Riddle, K.Thurber, P.Keen, R.H.Sprague Jr., B.Shriver, T.M.Walker, R.R.Grams (editor/s),* [HI, USA: Hawaii Int. Conference Syst. Sci. 1982] 99180, 100591, 103989−90, 104001, 104042−4

First stellar generations; Vulcano, Eolie, Italy, 6-10 Sept. 1982, [1983] 98637 (introductory abstract),

Giant planets and their satellites; Ottawa, Canada, 16 May-2 June 1982, *(COSPAR; IAU; URSI; et al)* [1983] 98618 (introductory abstract),

Group theoretical methods in physics; Istanbul, Turkey, 23-28 Aug. 1982, *M.Serdaroglu, E.Inonu (editor/s),* [Berlin, Germany: Springer-Verlag 1983] 98719−23, 98758, 98858−9, 98918, 98947, 99035−6, 99069, 99332−4, 99365−6, 99517−23

Halide and other nonoxide glasses; Cambridge, England, 23-26 March 1982, [June 1983] 98625 (introductory abstract), 100909−12, 101561−2, 102043, 102863, 103104−5

Intercalated graphite; Boston, MA, USA, 1-3 Nov. 1982, *M.S.Dresselhaus, G.Dresselhaus, J.E.Fischer, M.J.Moran (editor/s),* [New York, USA: North-Holland 1983] 102793

Laser diagnostics and photochemical processing for semiconductor devices; Boston, MA, USA, Nov. 1982, *(Air Force Office Sci. Res) R.M.Osgood, S.R.J.Brueck, H.R.Schlossberg (editor/s),* [New York, USA: North-Holland 1983] 98648 (introductory abstract), 100935, 101721, 101732−4, 101764, 102182, 102212−13, 102894−5, 102955, 103063−70, 103366−7, 103406−7

Laser-solid interactions and transient thermal processing of materials; Boston, MA, USA, 1-4 Nov. 1982, *(US DOE) J.Narayan, W.L.Brown, R.A.Lemons (editor/s),* [New York, USA: Elsevier 1983] 98657 (introductory abstract), 101558−60, 101611, 101725, 101735−6, 101740−2, 101759−60, 101765−91, 101802, 101823, 101989−90, 102073, 102214−16, 103009, 103047

Lattice defects in ionic crystals; Dublin, Ireland, 29 Aug.-3 Sept. 1982, *(Aer Lingus; Bank of Ireland; An Bord Bainne; et al)* [1983] 98642 (introductory abstract), 101688, 101693−702, 101792−4, 101799, 101819, 101846, 102315, 102334, 102407, 102420−1, 102741, 102778−9, 102781, 102889−90, 102906, 102917, 102947−51, 102972−3

Liquid crystals; Bangalore, India, 6-10 Dec. 1982, [1983] 100455, 100597, 101545−51, 101965−7, 101983, 101995, 102771, 102899, 103824

Low temperature physics; Visegrad, Hungary, 8-10 Oct. 1981, [1982] 98614 (introductory abstract), 99137, 101714, 102345−6, 102373, 102427, 102495, 102545−6, 102559, 102590, 102592−5, 102597, 102696

LWR safety; Los Angeles, CA, USA, 6-11 June 1982, [Sept. 1982] 99708 (introductory abstract), 99709−12

Magnetosphere plasma and energetic particles; Leeds, England, 23-27 Aug. 1982, [1983] 98635 (introductory abstract), 104607, 104659, 104675−82

Mathematical analysis and applications; Madras, India, 12-13 Nov. 1982, [April 1983] 98633 (introductory abstract), 98933, 99026, 99280

Midcon 82; Dallas, TX, USA, 30 Nov.-2 Dec. 1982, [El Segundo, CA, USA: Electron. Conventions 1982] 100974, 101936

Modeling and simulation on microcomputers; San Diego, CA, USA, 1983, *R.Martinez (editor/s),* [La Jolla, CA, USA: SCS 1983] 103745

Neutrino mass and gauge structure of weak interactions; Cable, WI, USA, Sept. 1982, [1983] 99371−5, 99455, 99538−43

Neutron radiography; San Diego, CA, USA, 7-10 Dec. 1981, *(ASTM; American Soc. Nondestructive Testing; British Inst. Nondestructive Testing) J.P.Barton, P.Von Der Hardt (editor/s),* [Dordrecht, Netherlands: Reidel 1983] 98644 (introductory abstract), 99083, 99249−59, 99628−66, 99689, 99694−5, 100197−201, 100585, 100647, 103450−89, 104039−41, 104151−4

Niagara River-Lake Ontario Pollution Problem; Sault Ste. Marie, Ont., Canada, May 1982, [1983] 98615 (introductory abstract),

Nonlinear finite element analysis and ADINA; Cambridge, MA, USA, 15-17 June 1983, [1983] 98619 (introductory abstract), 98769, 99617−20, 101032, 101052−4, 101073−5, 101090, 101102−4, 101131−7, 103171, 104122

On the 90th anniversary of the birth of O.Yu. Shmidt; Moscow, USSR, 26-27 Oct. 1981, [1982] 98629 (introductory abstract),

Optics and images in law enforcement II; Arlington, VA, USA, 4-5 May 1982, [1982] 98621 (introductory abstract),

Physics of superionic conductors and electrode materials; Odense, Denmark, 4-22 Aug. 1980, *J.W.Perram (editor/s),* [New York, USA: Plenum Press 1983] 98655 (introductory abstract), 101522, 101627−32, 101925, 102018, 102052−7

Planet Mars; Leeds, England, 27 Aug. 1982, [Paris, France: ESA 1982] 98656 (introductory abstract),

Psychological uses of online computers; Minneapolis, MN, USA, 1982, [April 1983] 100668, 103857, 104131

Quantum gravity; London, England, 3-21 Aug. 1981, *M.J.Duff, C.J.Isham (editor/s),* [Cambridge, England: Cambridge 1982] 98651 (introductory abstract), 98903−13, 98919−27, 99335, 99367, 105003−6

Radiation damage analysis for fusion reactors; St. Louis, MO, USA, 25-28 Oct. 1982, *(TMS-AIME/ASM Nucl. Metall. Committee; ASM Electr., Magnetic & Opt. Phenomena Activity)* [July 1983] 98632 (introductory abstract), 99718, 101690, 101748−58, 101804−17

Radioactive waste treatment and handling; Richland, WA, USA, 19-22 April 1982, *A.G.Blasewitz, J.M.Davis, M.R.Smith (editor/s),* [Richland, WA, USA: Battelle Press 1983] 98646 (introductory abstract), 99667−86

Radiobiology of radium and the actinides in man; Lake Geneva, WI, USA, 11-16 Oct. 1981, [1983] 103740, 103966−71, 104054−6, 104063−9

Remote sensing and mineral exploration; Ottawa, Canada, 16 May-2 June 1982, *(COSPAR; Int. Union Geol. Sci.; URSI; et al)* [1983] 98617 (introductory abstract),

Remote sensing: data processing; West Lafayette, IN, USA, 21-23 June 1983, *(IEEE; Crop Sci. Soc. America; Soc. American Foresters; et al) D.C.McDonald, D.B.Morrison (editor/s),* [West Lafayette, IN, USA: Purdue Univ. 1983] 98645 (introductory abstract),

Rheological properties of polymers; Toronto, Ont. Canada, 30 May-2 June 1982, [mid-June 1983] 98641 (introductory abstract), 101163−6, 103200−1

Scientific ballooning-III; Ottawa, Canada, 16 May-2 June 1982, *(COSPAR)* [1983] 104583 (introductory abstract),

Semiconductor lasers; Ottawa, Ont., Canada, 13-15 Sept. 1982, [June 1983] 98628 (introductory abstract), 100722, 100732, 100757−62, 100815, 100833, 100843, 102411

Solar System solid bodies and magnetic fields; Ottawa, Canada, 16 May-2 June 1982, *(COSPAR; IAU; et al)* [1982] 98616 (introductory abstract),

Space biology; Cologne, Germany, 9-11 March 1983, *(Eur. Low Gravity Res. Assoc.; ESA; German Aerospace Res. Establ)* [Noordwijk, Netherlands: ESA 1983] 98659 (introductory abstract), 104076−87

Structural elements in particle physics and statistical mechanics; Freiburg, Germany, 31 Aug.-11 Sept. 1981, *(NATO) J.Honerkamp, K.Pohlmeyer, H.Romer (editor/s),* [New York, USA: Plenum 1983] 98660 (introductory abstract), 98860, 99000, 99037−41, 99339−51, 99368, 99394−5, 99443, 102609, 102613

Utilization of infrared technology; San Diego, CA, USA, 26-27 Aug. 1982, [1983] 98624 (introductory abstract), 99182−4, 100530, 103420, 103525, 104563

Vacuum symposium, Kobe 1982; Kobe, Japan, 1982, [1983] 98634 (introductory abstract),

Wescon '80; Anaheim, CA, USA, 16-18 Sept. 1980, [El Segundo, CA, USA: Electron. Conventions 1980] 100831

Wescon '81; San Francisco, CA, USA, 15-17 Sept. 1981, [El Segundo, CA, USA: Electron. Conventions 1981] 99094, 100983−4, 103669−73, 104126−7

Western educational computing 82; San Diego, CA, USA, 18-19 Nov. 1982, *(California Educ. Comput. Consortium)* [CA, USA: California Educ. Comput. Consortium 1982] 98708

CORPORATE AUTHOR INDEX

Atomic Energy Canada Ltd., Chalk River, Ont.
  Acoustic lenses - Focusing in on defects, AECL-7981. 101000
  Guide to the Canadian nuclear fuel waste management program. Second edition, AECL-7790. 99627
  Ion-implantation dense cascade data, AECL-8054. 101731

Comm. European Communities, Luxembourg
  Atmospheric diffusion experiments performed in October 1980 at the Turbigo ENEL power plant, EUR 8334 EN. 103765

Hungarian Acad. Sci., Budapest
  Canonical quantization of local scalar fields over quantum space-time, KFKI-1983-51. 98865

Ist. Naz. Fis. Nucl., Catania, Italy
  Chirons, Geminions, Centauros, decays into pions: A phenomenological and theoretical analysis, INFN/AE-83/3. 99488

Ist. Naz. Fis. Nucl., Pisa, Italy
  Synchrotron radiation from the low-beta quadrupoles scattered back toward the short insertion of LEP, INFN/AE-83/2. 99919

KEK, Nat. Lab. for High Energy Phys., Ibaraki, Japan
  Photon factory: status of storage ring, . 99883

Kernforschungsanlage, Julich, Germany
  Atomic displacement rates of light ions in cubic metals, JUL-1823. 99626

Machine Control Group, DESY, Hamburg, Germany
  Accelerator controls at DESY, . 99842

Rutherford Appleton Lab., Chilton, Oxon., England
  Effect of confinement size on nuclear structure functions, RL-83-051. 99532
  Track and vertex fitting in an inhomogeneous magnetic field, RL-83-006. 100218

CUMULATIVE INDEXES

Cumulative indexes are available for *Physics Abstracts, Electrical & Electronics Abstracts* and *Computer & Control Abstracts*, for both authors and subjects. These cumulations generally cover a period of four years, with the exception of *Computer & Control Abstracts* where the initial volume covered the period 1966–68. The table below shows the prices and periods for the two types of cumulative index.

	PHYSICS ABSTRACTS		ELECTRICAL & ELECTRONICS ABSTRACTS		COMPUTER & CONTROL ABSTRACTS	
	Subject	Author	Subject	Author	Subject	Author
	£	£	£	£	£	£
1955-59	20	20	15	20	—	—
1960-64	40	17	20	12	—	—
1965-68	60	25	35	20	—	—
1969-72	—	—	72	64	48	30
1973-76	600	300	250	150	150	75
1977-80	770	450	380	250	250	120
1966-68	—	—	—	—	15

ORDERING PROCEDURE

THE AMERICAS

North (including Canada), Central and South

All orders from the above areas, and orders from members of Institute of Electrical and Electronics Engineers Inc. anywhere in the world, should be sent to Fulfillment Manager, Institute of Electrical & Electronics Engineers Inc., 445 Hoes Lane, Piscataway, N.J. 08854, USA. Telephone (201) 981 0060

日本のお客様にご案内申し上げます

日本国内に於けるINSPECの購入価格はすべて円建てとなっております　また刊行物はすべて航空便で配達されます　INSPEC刊行物の価格、その他についてのお問合わせは最寄の洋書取扱専門店または輸入総代理店㈱ユー・エス・エシアテック　カンパニー　〒105東京都港区新橋1　13　12、TEL 03（502）6471までご連絡ください

REMAINDER OF THE WORLD

All remaining subscriptions should be sent to INSPEC Marketing Department, P O Box 26, Hitchin, Herts SG5 7RS, England. Telephone Hitchin 53331, Telex 825962, Telegrams IEE G.

OTHER INSPEC SERVICES

SDI

(Selective Dissemination of Information.) This is a service individually tailored to the requirements and interests of the engineer or research worker. Details of information relevant to the interest profile of the individual subscriber are selected from the data being processed for the INSPEC database. Information is dispatched weekly on 150 mm × 100 mm (6″ × 4″) cards.

TOPICS

This is an SDI service based on standard profiles. There are over 70 subjects covering high-activity areas of research and development. This is an inexpensive card service designed to alert engineers and researchers to the availability of literature within their subject area.

MAGNETIC TAPES

Tapes containing all the information included in the INSPEC publications are issued twice monthly. They enable the larger research and development organisations to produce their own internal information and current-awareness services.

Physics Abstracts

1st November 19

Summary Classification

The full classification and contents are given at the front of the journal, followed by an **Alphabetical Index** to the subjects covered

00.00	**General**
01.00	Communication, Education, History and Philisophy
02.00	Mathematical Methods in Physics
03.00	Classical and Quantum Physics; Mechanics and Fields
04.00	Relativity and Gravitation
05.00	Statistical Physics and Thermodynamics
06.00	Measurement Science, General Laboratory Techniques, and Instrumentation Systems
07.00	Specific Instrumentation and Techniques of General Use in Physics
10.00	**The Physics of Elementary Particles and Fields**
11.00	General Theory of Fields and Particles
12.00	Specific Theories and Interaction Models; Particle Systematics
13.00	Specific Reactions and Phenomenology
14.00	Properties of Specific Particles and Resonances
20.00	**Nuclear Physics**
21.00	Nuclear Structure
23.00	Radioactivity and Electromagmetic Transitions
24.00	Nuclear Reactions and Scattering: General
25.00	Nuclear Reactions and Scattering: Specific Reactions
27.00	Properties of Specific Nuclei listed by Mass Ranges
28.00	Nuclear Engineering and Nuclear Power Studies
29.00	Experimental Methods and Instrumentation for Elementary-Particle and Nuclear Physics
30.00	**Atomic and Molecular Physics**
31.00	Theory of Atoms and Molecules
32.00	Atomic Spectra and Interactions with Photons
33.00	Molecular Spectra and Interactions with Photons
34.00	Atomic and Molecular Collision Processes and Interactions
35.00	Properties of Atoms and Molecules; Instruments and Techniques
36.00	Studies of Special Atoms and Molecules
40.00	**Classical Areas of Phenomenology**
41.00	Electricity and Magnetism; Fields and Charged Particles
42.00	Optics
43.00	Acoustics
44.00	Heat Flow, Thermal and Thermodynamic Processes
46.00	Mechanics, Elasticity, Rheology
47.00	Fluid Dynamics
50.00	**Fluids, Plasmas and Electric Discharges**
51.00	Kinetic and Transport Theory of Fluids; Physical Properties of Gases
52.00	The Physics of Plasmas and Electric Discharges
60.00	**Condensed Matter: Structure, Thermal and Mechanical Properties**
61.00	Structure of Liquids and Solids; Crystallography
62.00	Mechanical and Acoustic Properties of Condensed Matter
63.00	Lattice Dynamics and Crystal Statistics
64.00	Equations of State, Phase Equilibria, and Phase Transitions
65.00	Thermal Properties of Condensed Matter
66.00	Transport Properties of Condensed Matter (Nonelectronic)
67.00	Quantum Fluids and Solids; Liquid and Solid Helium
68.00	Surfaces and Interfaces; Thin Films and Whiskers
70.00	**Condensed Matter: Electronic Structure, Electrical, Magnetic, and Optical Properties**
71.00	Electron States
72.00	Electronic Transport in Condensed Matter
73.00	Electronic Structure and Electrical Properties of Surfaces, Interfaces, and Thin Films
74.00	Superconductivity
75.00	Magnetic Properties and Materials
76.00	Magnetic Resonances and Relaxation in Condensed Matter; Mossbauer Effect
77.00	Dielectric Properties and Materials
78.00	Optical Properties and Condensed Matter Spectroscopy and other Interactions of Matter with Particles and Radiation
79.00	Electron and Ion Emission by Liquids and Solids; Impact Phenomena
80.00	**Cross-Disciplinary Physics and Related Areas of Science and Technology**
81.00	Materials Science
82.00	Physical Chemistry
86.00	Energy Research and Environmental Science
87.00	Biophysics, Medical Physics, and Biomedical Engineering
90.00	**Geophysics, Astronomy and Astrophysics**
91.00	Solid Earth Geophysics
92.00	Hydrospheric and Atmospheric Geophysics
93.00	Geophysical Observations, Instrumentation, and Techniques
94.00	Aeronomy and Space Physics
95.00	Fundamental Astronomy and Astrophysics, Instrumentation and Techniques and Astronomical Observations
96.00	Solar System
97.00	Stars
98.00	Stellar Systems; Galactic and Extragalactic Objects and Systems; The Universe
